Printing History

Edition 1 June 2003

Welcome to the hp 17bII+

The hp 17bll+ is part of Hewlett-Packard's new generation of calculators:

- The two-line display has space for messages, prompts, and labels.
- Menus and messages show you options and guide you through problems.
- Built-in applications solve these business and financial tasks:
 - **Time Value of Money.** For loans, savings, leasing, and amortization.
 - Interest Conversions. Between nominal and effective rates.
 - Cash Flows. Discounted cash flows for calculating net present value and internal rate of return.
 - **Bonds.** Price or yield on any date. Annual or semi-annual coupons; 30/360 or actual/actual calendar.
 - **Depreciation.** Using methods of straight line, declining balance, sum-of-the-years' digits, and accelerated cost recovery system.
 - **Business Percentages.** Percent change, percent total, markup.
 - **Currency Exchange.** Exchange calculations between two currencies.
 - Statistics. Mean, correlation coefficient, linear estimates, and other statistical calculations.
 - Clock. Time, date, and appointments.
- Use the *Solver* for problems that aren't built in: type an equation and then solve for any unknown value. It's easier than programming!
- There are 28K bytes of memory to store data, lists, and equations.
- You can print information using the hp 82240 Infrared Printer.
- You can choose either ALG (Algebraic) or RPN (Reverse Polish Notation) entry logic for your calculations.

Important Information

- Take the time to read chapter 1. It gives you an overview of how the calculator works, and introduces terms and concepts that are used throughout the manual. After reading chapter 1, you'll be ready to start using all of the calculator's features.
- You can choose either ALG (Algebraic) or RPN (Reverse Polish Notation) mode for your calculations. Throughout the manual, the "✓" in the margin indicates that the examples or keystrokes must be performed differently in RPN. Appendixes D, E, and F explain how to use your calculator in RPN mode.
- Match the problem you need to solve with the calculator's capabilities and read the related topic. You can locate information about the calculator's features using the table of contents, the subject index, the list of examples, and the menu maps in appendix C (the gold-edged pages).
- Before doing any time-value-of-money or cash-flow problems, refer to pages 64 and 92 to learn how the calculator uses positive and negative numbers in financial calculations.
- For a deeper treatment of specific types of calculations, refer to chapter 14, "Additional Examples." If you especially like learning by example, this is a good reference spot for you.

Getting Started

Watch for this symbol in the margin. It identifies examples or keystrokes that are shown in ALG mode and must be performed differently in RPN mode. Appendixes D, E, and F explain how to use your calculator in RPN mode.

The mode affects only arithmetic calculations — all other operations, including the Solver, work the same in RPN and ALG modes.

Power On and Off; Continuous Memory

To turn on the calculator, press CLR (clear) (note ON printed below the key). To turn it off, press and then CLR. This shifted function is called OFF (note OFF printed above the key). Since the calculator has Continuous Memory, turning it off does not affect the information you've stored there.

To conserve energy, the calculator turns itself off after 10 minutes of no use.

If you see the low battery symbol () at the top of the display, you should replace the batteries as soon as possible. Follow the instructions on page 224.

Adjusting the Display Contrast

The display's brightness depends on lighting, your viewing angle, and the display contrast setting. To change the display contrast, hold down the CLR key and press + or -.

Setting the Language

The calculator can display information in six different languages. The language initially used by the calculator was preset at the factory. To change the language:

- **1.** Press the MODES.
- Press INTL to display the INTL menu, which stands for "international".
- **3.** Press the appropriate menu key to change the language.

Table 1-1. Keys for language

What You See in the Display

Menu Labels. The bottom line of the display shows the menu labels for each of the six major menus (work areas) in the calculator. More about these later in this chapter.

The Calculator Line. The calculator line is where you see numbers (or letters) that you enter, and the results of calculations.

Annunciators. The symbols shown here are called *annunciators*. Each one has a special significance.

The Shift Key (

Some keys have a second, *shifted* function printed in color above the key. The colored shift key accesses these operations. For example, pressing and releasing , then pressing CLR turns the calculator off. This is written Foff.

Pressing \square turns on the shift annunciator (\longrightarrow). This symbol stays on until you press the next key. If you ever press \square by mistake, just press \square again to turn off the \longrightarrow .

Backspacing and Clearing

The following keys erase typing mistakes, entire numbers, or even lists or sets of data.

Table 1-2. Keys for Clearing

Key	Description
•	Backspace; erases the character before the cursor.
CLR	Clear; clears the calculator line. (When the calculator is off, this key turns the calculator on, but without clearing anything.)
CLR DATA	This clears all information in the current work area (menu). For example, it will erase all the numbers in a list if you are currently viewing a list (SUM or CFLO). In other menus (like TVM), CLRDATA clears all of the values that have been stored. In SOLVE, it can delete all equations.

The cursor (■) is visible while you are keying in a number or doing a calculation. When the cursor is visible, pressing • deletes the last character you keyed in. When the cursor is not visible, pressing • erases the last number.

Keys:	Display:	Description:
12345		Backspacing removes
.66	123.66∎	the 4 and 5.
-1/x	0.01	Calculates 1/123.66.
	0.00	Clears the calculator
		line.

In addition, there are more drastic clearing operations that erase more information at once. Refer to "Resetting the Calculator" on page 228 in appendix A.

Doing Arithmetic

The " \checkmark " in the margin is a reminder that the example keystrokes are for ALG mode.

This is a brief introduction to doing arithmetic. More information on arithmetic is in chapter 2. Remember that you can erase errors by pressing • or CLR.

To calculate 21.1 + 23.8:

Keys:	Display:	Description:
21.1 +	21.10+	
23.8	21.10+23.8	
	44.90	= completes calculation.

Once a calculation has been completed, pressing another digit key starts a new calculation. On the other hand, pressing an operator key continues the calculation:

77.35 🖃	77.35-	Calculates 77.35 – 90.89
90.89 =	-13.54	
65 (x) × 12		New calculation:
	96.75	$\sqrt{65} \times 12$.
÷ 3.5 =	27.64	Calculates 96.75 ÷ 3.5.

You can also do long calculations *without* pressing \equiv after each intermediate calculation—just press it at the end. The operators perform from left to right, in the order you enter them. Compare:

$$\frac{65+12}{3.5} \qquad \text{and} \qquad 65+\frac{12}{3.5}$$

$$65 + 12 \div \qquad \qquad \text{Operations occur in the}$$

$$3.5 = \qquad \qquad 22 \cdot 00 \qquad \qquad \text{order you see them.}$$

65 + (12 ÷ 3.5) = 68.43

Use parentheses to impose an order of calculation.

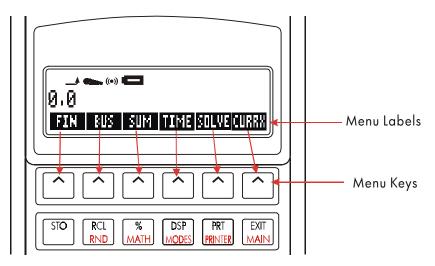

Keying in Negative Numbers (₩)

- To key in a negative number, type that number, then press +/-.
- To change the sign of an already displayed number (it must be the rightmost number), press +/-.

Keys:	Display:	Description:
75 +/-	-75	Changes the sign of 75.
√ × 7.1 =	-532.50	Multiplies -75 by 7.1.

Using the Menu Keys

The calculator usually displays a set of labels across the bottom of the display. The set is called a *menu* because it presents you with choices. The MAIN menu is the starting point for all other menus.

The top row of keys is related to the labels along the bottom of the display. The labels tell you what the keys do. The six keys are called *menu keys*; the labels are called *menu labels*.

The MAIN Menu

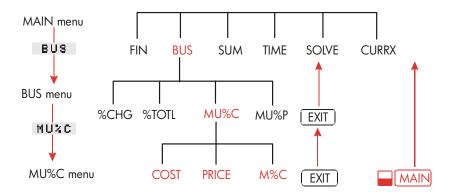

The MAIN menu is a set of primary choices leading to other menu options. No matter which menu you currently see, pressing MAIN redisplays the MAIN menu. The menu structure is hierarchical.

Table 1-3. The MAIN Menu

Menu Label	Operations Done in This Category	Covered in:
FIN (Finance)	TVM: Time value of money: loans, savings, leasing, amortization.	Chapter 5
	ICNV: Interest conversions.	Chapter 6
	CFLO: Lists of cash flows for internal rate of return and net present value.	Chapter 7
	BOND: Yields and prices for bonds.	Chapter 8
	DEPRC: Depreciation using SL, DB, and SOYD methods, or ACRS.	Chapter 9
BUS (Business Percentages)	Percent of total, percent change, markup on cost, markup on price.	Chapter 3
SUM (Statistics)	Lists of numbers, running total, mean, weighted statistics, forecasting, summation statistics, and more.	Chapter 10
TIME (Time Manager)	Clock, calendar, appointments, date arithmetic.	Chapter 11
SOLVE (Equation Solver)	Creates customized menus from your own equations for calculations you do often.	Chapter 12
CURRX (Currency Exchange)	Converting any currency to its equivalent in another currency	Chapter 4

Choosing Menus and Reading Menu Maps

Below is a *menu map* illustrating one possible path through three levels of menus: from the MAIN menu to the BUS menu to the MU%C (*markup as a percent of cost*) menu. There are no menus that branch from the MU%C menu because the MU%C menu is a final destination—you use it to do calculations, rather than to choose another menu.

- Press BUS to choose the BUS menu. Then press MUXC to choose the MU%C menu.
- Press EXIT to return to the previous menu. Pressing EXIT enough times returns you to the MAIN menu.
- Press MAIN to return to the MAIN menu directly.

When a menu has more than six labels, the label MORE appears at the far right. Use it to switch between sets of menu labels on the same "level".

Example: Using Menus. Refer to the menu map for MU%C (above) along with this example. The example calculates the percent markup on cost of a crate of oranges that a grocer buys for \$4.10 and sells for \$4.60.

Step 1. Decide which menu you want to use. The MU%C (markup as a percent of cost) menu is our destination. If it's not obvious to you which menu you need, look up the topic in the subject index and examine the menu maps in appendix C.

Displaying the MU%C menu:

- **Step 2.** To display the MAIN menu, press MAIN. This step lets you start from a known location on the menu map.
- **Step 3.** Press BUS to display the BUS menu.
- **Step 4.** Press MU^{*}C to display the MU^{*}C menu.

Using the MU%C menu:

Step 5. Key in the cost and press COST to store 4.10 as the COST.

- **Step 6.** Key in the price and press PRICE to store 4.60 as the *PRICE*.
- Step 7. Press MC to calculate the markup as a percent of cost.

 The answer: MARKUP%C=12.20.

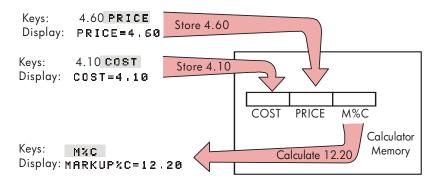

MARKUP%C=12.20

Step 8. To leave the MU%C menu, press EXIT twice (once to get back to the BUS menu, and again to get to the MAIN menu) or MAIN (to go directly to the MAIN menu).

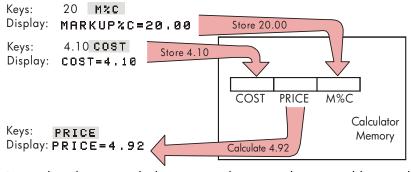

Calculations Using Menus

Using menus to do calculations is easy. You don't have to remember in what order to enter numbers and in what order results come back. Instead, the menus guide you, as in the previous example. All the keys you need are together in the top row. The menu keys both store numbers for the calculations and start the calculations.

The MU%C menu can calculate M%C, the percent markup on cost, given COST and PRICE.

Then the same menu can calculate *PRICE* given *COST* and *M%C*.

Notice that the two calculations use the same three variables; each variable can be used both to store and calculate values. These are called *built-in variables*, because they are permanently built into the calculator.

Many menus in this calculator work like the example above. The rules for using variables are:

- **To store a value**, key in the number and press the menu key.*† Arithmetic calculations, as well as single values, can be stored.
- To calculate a value, press the menu key without first keying in a number. The calculator displays CALCULATING... when a value is being calculated.
- **To verify a stored value**, press RCL (*recall*) followed by the menu key. For example, RCL COST displays the value stored in COST.
- To transfer a value to another menu, do nothing if it is displayed (that is, it is in the calculator line). A number in the calculator line remains there when you switch menus. To transfer more than one value from a menu, use storage registers. See page 45, "Storing and Recalling Numbers."

Exiting Menus (EXIT)

The EXIT key is used to leave the current menu and go back to the previously displayed menu (as shown in the previous example). This is true for menus you might pick by accident, too: EXIT gets you out.

Clearing Values in Menus

The CLRDATA key is a powerful feature to clear all the data in the currently displayed menu, giving you a clean slate for new calculations.

■ If the current menu has variables (that is, if the display shows menu labels for variables, such as COST, PRICE, and M%C in the MU%C menu), pressing □CLRDATA clears the values of those variables to zero.

^{*} If you have just switched menus and want to store the result already in the calculator line, then you should press STO before the menu key

[†] To store the same number into two different variables, use STO for the second variable, e.g. 25 PRICE STO COST

■ If the current menu has a list (SUM, CFLO, or Solver), pressing □ CLR DATA clears the values in the list.

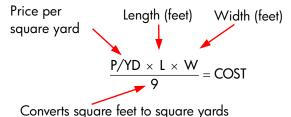

To see what value is currently stored in a variable, press RCL menu label.

Solving Your Own Equations (SOLVE)

This chapter has introduced some of the built-in menus the calculator offers. But if the solution to a problem is not built into hp 17bll+, you can turn to the most versatile feature of all: the Equation Solver. Here you define your own solution in terms of an equation. The Solver then creates a menu to go with your equation, which you can use over and over again, just like the other menus in the calculator.

The Solver is covered in chapter 12, but here is an introductory example. Because equations usually use letters of the alphabet, this section also explains how to type and edit letters and other characters that aren't on the keyboard.

Example:Using the Solver. Suppose you frequently buy carpet and must calculate how much it will cost. The price is quoted to you per square yard. Regardless of how you do the calculation (even if you do it longhand), you are using an equation.

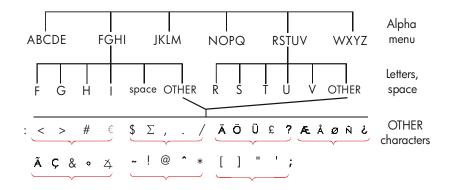

To type this equation into the Solver, use the ALPHA menu.

Typing Words and Characters: the ALPHAbetic Menu

The ALPHAbetic menu is automatically displayed when you need it to type letters and characters. The ALPHA menu also includes characters not found on the keyboard:

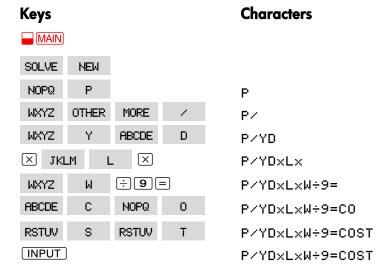

- Uppercase letters.
- Space.
- Punctuation and special characters.
- Non-English letters.

To type a letter you need to press two keys; for example, \mathbf{A} is produced by the keystrokes \mathbf{ABCDE}

Each letter menu has an OTHER key for accessing punctuation and non-English characters. The letter menus with just four letters (for example, FGHI) include a space character ().

To familiarize yourself with the ALPHA menu, type in the equation for the cost of carpeting. The necessary keystrokes are shown below. (Note the access to the special character, "/".) Use , if necessary, to make corrections. If you need to do further editing, refer to the next section, "Editing ALPHAbetic Text." When you're satisfied that the equation is correct, press INPUT to enter the equation into memory.

Note that the \times is just a character, part of the variable's name. It is *not* an operator, which \div is.

Editing ALPHAbetic Text

The companion to the ALPHA menu is the ALPHA-Edit menu. To display the ALPHA-Edit menu, press EDIT in the SOLVE menu (or press EXIT in the ALPHA menu).

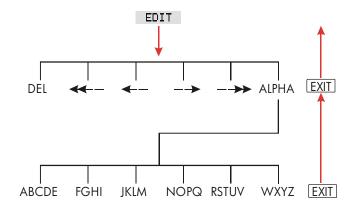

Table 1-4. Alphabetic Editing

Operation	Label or Key to Press
ALPHA-Edit Menu	
Inserts character before the cursor.	Any character.
Deletes character at the cursor.	DEL
Moves the cursor far left, one display-width.	<<

Clears the calculator line.	CLR

Calculating the Answer (CALC)

After an equation is input, pressing CALC verifies it and creates a new, customized menu to go with the equation.

Menu labels for your variables

Each of the variables you typed into the equation now appears as a menu label. You can store and calculate values in this menu the same way you do in other menus.

Calculate the cost of carpet needed to cover a 9' by 12' room. The carpet costs \$22.50 per square yard.

Starting from the MAIN menu (press MAIN):

Keys:	Display:	Description:
SOLVE	P∕YDxLxW÷9=COST	Displays the SOLVE menu and the current equation.*
CALC		Displays the customized menu for carpeting.
22.5 P/YD	P/YD=22.50	Stores the price per square yard in <i>P/YD</i> .
12 L	L=12.00	Stores the length in <i>L</i> .
9 W	W=9.00	Stores the width in W.
COST	COST=270.00	Calculates the cost to
		cover a 9' x 12' room.

Now determine the most expensive carpet you can buy if the maximum amount you can pay is \$300. Notice that all you need to do is enter the one value you are changing—there is no need to re-enter the other values.

300 COST	COST=300.00	Stores \$300 in COST.
P/YD	P/YD=25.00	Calculates the maximum
		price per square yard you
		can pay.
EXIT EXIT		Exits Solver.

^{*} If you entered this equation but don't see it now, press $lack \Delta$ or $lack \nabla$ until you do.

Controlling the Display Format

The DSP menu (press DSP) gives you options for formatting numbers. You can pick the number of decimal places to be displayed, and whether to use a comma or a period to "punctuate" your numbers.

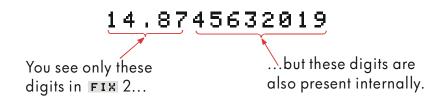

Decimal Places

To change the number of displayed decimal places, first press the DSP key. Then either:

- Press FIX , type the number of decimal places you want (from 0 to 11), and press INPUT; or
- Press FLL to see a number as precisely as possible at any time (12 digits maximum).

Internal Precision

Changing the number of displayed decimal places affects what you see, but does not affect the internal representation of numbers. The number inside the calculator always has 12 digits.

Temporarily SHOWing ALL

To temporarily see a number with full precision, press SHOW. This shows you the ALL format for as long as you hold down SHOW.

Rounding a Number

The RND function rounds the number in the calculator line to the number of displayed decimal places. Subsequent calculations use the rounded value.

Starting with two displayed decimal places:

Keys:	Display:	Description:
5.787	5.787∎	
DSP FIX		Four decimal places are
4 INPUT	5.7870	displayed.
DSP ALL	5.787	All significant digits;
		trailing zeros dropped.
DSP FIX		Two decimal places are
2 INPUT	5.79	displayed.
SHOW	FULL PRECISION IS:	Temporarily shows full
(hold)	5.787	precision.
RND		Rounds the number to two
SHOW (hold)	5.79	decimal places.

Exchanging Periods and Commas in Numbers

To exchange the periods and commas used for the decimal point and digit separators in a number:

- **1.** Press DSP to access the DSP (display) menu.
- 2. Specify the decimal point by pressing or . Pressing sets a period as the decimal point and comma as the digit separator (U.S. mode). (For example, 1,000,000.00.) Pressing sets a comma as the decimal point and period as the digit separator (non-U.S. mode). (For example, 1.000.000,00.)

Error Messages

Sometimes the calculator cannot do what you "ask", such as when you press the wrong key or forget a number for a calculation. To help you correct the situation, the calculator beeps and displays a message.

- Press CLR or to clear the error message.
- Press any other key to clear the message and perform that key's function.

For more explanations, refer to the list of error messages just before the subject index.

Modes

Beeper. Beeping occurs when a wrong key is pressed, when an error occurs, and during alarms for appointments. You can suppress and reactivate the beeper in the MODES menu as follows:

- 1. Press MODES.
- **2.** Pressing BEEP will simultaneously change and display the current setting for the beeper:
 - BEEPER ON beeps for errors and appointments.
 - BEEPER ON: APPTS ONLY beeps only for appointments.
 - BEEPER OFF silences the beeper completely.
- 3. Press EXIT when done.

Print. Press MODES PRMT to specify whether or not the printer ac adapter is in use. Then press EXIT.

Double Space. Press MODES DBL to turn double-spaced printing on or off. Then press EXIT.

Algebraic. Press **→** MODES ALG to select algebraic entry logic.

RPN. Press MODES RPN to select Reverse Polish Notation entry logic.

Language. Press MODES INTL to change the language.

Calculator Memory (MEM)

The calculator stores many different types of information in its memory. Each piece of information requires a certain amount of storage space.* You can monitor the amount of available memory by pressing MEM.

Number of bytes of memory still free

Percentage of total memory still free

The amount of memory available for storing information and working problems is about 30,740 bytes. (Units of memory space are called bytes.) The calculator gives you complete flexibility in how you use that available memory (such as for lists of numbers or equations). Use as much of the memory as you want for any task you want.

If you use nearly all of the calculator's memory, you'll encounter the message INSUFFICIENT MEMORY. To remedy this situation, you must erase some previously stored information. Refer to "Managing Calculator Memory" on page 227 in appendix A.

The calculator also allows you to erase at once *all* the information stored inside it. This procedure is covered in "Erasing Continuous Memory" on page 230.

^{*} Storing numbers in menus like TVM (non-Solver menus) does *not* use any of your memory space.

Arithmetic

If you prefer RPN to algebraic logic, please read appendix D before you read this chapter. The " \checkmark " in the margin is a reminder that the example keystrokes are for ALG mode.

The Calculator Line

The calculator line is the part of the display where numbers appear and calculations take place. Sometimes this line includes labels for results, such as TOTAL=124.60. Even in this case you can use the number for a calculation. For example, pressing + 2 = would calculate 124.60 plus 2, and the calculator would display the answer, 126.60.

There is always a number in the calculator line, even though sometimes the calculator line is hidden by a message (such as SELECT COMPOUNDING). To see the number in the calculator line, press , which removes the message.

Doing Calculations

Simple calculating was introduced in chapter 1, page 21. Often longer calculations involve more than one operation. These are called *chain calculations* because several operations are "chained" together. To do a chain calculation, you don't need to press \blacksquare after each operation, but only at the very end.

For instance, to calculate $\frac{750 \times 12}{360}$ you can type either:

38 2: Arithmetic

In the second case, the \div key acts like the \equiv key by displaying the result of 750 x 12.

Here's a longer chain calculation.

$$\frac{456 - 75}{18.5} \times \frac{68}{1.9}$$

This calculation can be written as: $456 - 75 \div 18.5 \times 68 \div 1.9$. Watch what happens in the display as you key it in:

Keys:	Display:
456 - 75 ÷	381.00÷
18.5 ⋉	20.59x
68 ÷	1,400,43
1.9 =	737.07

√Using Parentheses in Calculations

Use parentheses when you want to postpone calculating an intermediate result until you've entered more numbers. For example, suppose you want to calculate:

$$\frac{30}{85-12} \times 9$$

If you were to key in 30 \div 85 —, the calculator would calculate the intermediate result, 0.35. However, that's not what you want. To delay the division until you've subtracted 12 from 85, use parentheses:

Keys:	Display:	Description:
30 ⊕ € 85 −	30.00÷(85.00-	No calculation is done.
12 🕥	30.00÷73.00	Calculates 85 – 12.
× 9	0.41×9	Calculates 30 / 73.
	3.70	Calculates 0.41x 9.

Note that you must include a \times for multiplication; parentheses do *not* imply multiplication.

√ The Percent Key

The % key has two functions:

Finding a Percentage. In most cases, % divides a number by 100. The one exception is when a plus or minus sign precedes the number. (See "Adding or Subtracting a Percentage," below.)

For instance, 25 % results in 0.25.

To find 25% of 200, press: 200 × 25 % =. (Result is 50.00.)

Adding or Subtracting a Percentage. You can do this all in one calculation:

For instance, to decrease 200 by 25%, just enter 200 - 25 % =. (Result is 150.00.)

Example: Calculating Simple Interest. You borrow \$1,250 from a relative, and agree to repay the loan in a year with 7% simple interest. How much money will you owe?

Keys:	Display:	Description:
1250 + 7 %	1,250,00+87,50	Interest on the loan is
		\$87.50.
	1,337,50	You must repay this
		amount at the end of one
		year.

The Mathematical Functions

Some of the math functions appear on the keyboard; others are in the MATH menu. Math functions act on the last number in the display.

40 2: Arithmetic

Table 2-1. Shifted Math Functions

Key	Description
-1/x	reciprocal
\sqrt{x}	square root
x^2	square

Keys:	Display:	Description:
4 = 1/x	0.25	Reciprocal of 4.
$20 \overline{\mathbf{x}}$	4.47	Calculates $\sqrt{20}$.
√ + 47.2 ×	51.67×	Calculates 4.47 + 47.20.
$\sqrt{1.1} = x^2$	51 · 67×1 · 21	Calculates 1.1 ² .
√ ≡	62.52	Completes calculation of
		$(4.47 + 47.2) \times 1.1^2$

√The Power Function (Exponentiation)

The power function, y, raises the preceding number to the power of the following number.

Keys:	Display:	Description:
125 ;	3 = 1,953,125.00	Calculates 125 ³ .
$125 \mathbf{y}^{x} 3$	3	Calculates the cube root of
$\boxed{1/x}$	5.00	125, which is the same as
		$(125)^{1/3}$.

The MATH Menu

To display the MATH menu, press MATH (the shifted % key). Like the other mathematics functions, these functions operate on only the last number in the display.

Table 2-2. The MATH Menu Labels

Menu Label	Description
LOG	Common (base 10) logarithm of a positive number.
10^X	Common (base 10) antilogarithm; calculates 10 ^x .
LN	Natural (base e) logarithm of a positive number.
EXP	Natural antilogarithm; <i>calculate</i> s e ^x .
N!	Factorial.
PI	Inserts the value for π into the display.

Keys:	Display:	Description:
2.5 MATH		Calculates 10 ^{2.5} .
10^X	316.23	
4 N!	24.00	Calculates the factorial of 4.
EXIT		Exits MATH menu.

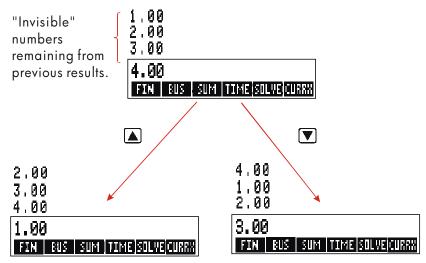

You can access the MATH menu when another menu is displayed. For instance, while using SUM you might want to use a MATH function. Just press MATH, then perform the calculation. Pressing EXIT returns you to SUM. The MATH result remains in the calculator line. Remember, however, that you must exit MATH before you resume using SUM.

Saving and Reusing Numbers

Sometimes you might want to include the result of a previous calculation in a new calculation. There are several ways to reuse numbers.

The History Stack of Numbers

When you start a new operation, the previous result moves out of the display but is still accessible. Up to four lines of numbers are saved: one in the display and three hidden. These lines make up the history stack.

The , and keys "roll" the history stack down or up one line, bringing the hidden results back into the display. If you hold down or , the history stack wraps around on itself. However, you cannot roll the history stack when an incomplete calculation is in the display. Also, you cannot gain access to the stack while using lists (SUM, CFLO) in ALG mode, or SOLVE in either ALG or RPN mode. All numbers in the history stack are retained when you switch menus.

Pressing $\blacksquare xzy$ exchanges the contents of the bottom two lines of the display.

Pressing CLRDATA clears the history stack. Be careful if a menu is active, because then **CLR DATA** also erases the data associated with that menu.

√Keys: **Display: Description:** 75.55 🖃 32.63

42.92 150 ÷ 7 =

42.92 moves out of 21.43 display.

Now, suppose you want to multiply 42.92 x 11. Using the history stack saves you time.

42.92

Moves 42.92 back to calculator line.

 \times 11 =472.12

√Reusing the Last Result (☐ LAST)

The LAST key copies the last result—that is, the number just above the calculator line in the history stack—into a current calculation. This lets you reuse a number without retyping it and also lets you break up a complicated calculation.

$$\frac{39 + 8}{\sqrt{123 + 17}}$$

Keys:	Display:	Description:
123 + 17 =	140.00	Calculates 123 + 17.
\sqrt{x}	11.83	Calculates $\sqrt{140}$.
39 + 8 = ÷		Copies 11.83 to the
LAST	47.00÷11.83	calculator line.
	3.97	Completes the calculation.

2: Arithmetic 44

An equivalent keystroke sequence for this problem would be:

Storing and Recalling Numbers

The STO key copies a number from the calculator line into a designated storage area, called a *storage register*. There are ten storage registers in calculator memory, numbered 0 through 9. The RCL key recalls stored numbers back to the calculator line.

✓If there is more than one number on the calculator line, STO stores only the last number in the display.

To store or recall a number:

- 1. Press STO or RCL. (To cancel this step, press •.)
- 2. Key in the register number.

The following example uses two storage registers to do two calculations that use some of the same numbers.

37.1	J	37.13
√Keys:	Display:	Description:
475.6 (STO) 1	475.60	Stores 475.6 into register 1.
÷ 39.15 STO		Stores 39.15 (rightmost
2	475.60÷39.15	number) into register 2.
	12.15	Completes calculation.
560.1 + RCL		Recalls contents of register
1	560.10+475.60	1.
÷RCL 2	1,035.70÷39.15	Recalls register 2.
	26.45	Completes calculation.

560.1 + 475.6 39.15 The STO and RCL keys can also be used with variables. For example, STO M™C (in the MU%C menu) stores the rightmost number from the display into the variable M%C. RCL M™C copies the contents of M%C into the calculator line. If there is an expression in the display (such as 2+4■), then the recalled number replaces only the last number.

You do not need to clear storage registers before using them. By storing a number into a register, you overwrite whatever existed there before.

Doing Arithmetic Inside Registers and Variables

You can also do arithmetic inside storage registers.

Keys:	Display:	Description:
45.7 STO 3	45.70	Stores 45.7 in reg. 3.
2.5 STO × 3	2.50	Multiplies contents of register 3 by 2.5 and stores result (114.25) back in register 3.
RCL 3	114.25	Displays register 3.

Table 2-3. Arithmetic in Registers

Keys	New Register Contents
STO +	old register contents + displayed number
STO -	old register contents – displayed number
STOX	old register contents x displayed number
STO ÷	old register contents ÷ displayed number
STO y ^x	old register contents ^ displayed number

You can also do arithmetic with the values stored in variables. For example, 2 $\overline{STO} \times \overline{M}^*C$ (in the MU%C menu) multiplies the current contents of M%C by 2 and stores the product in M%C.

Scientific Notation

Scientific notation is useful when working with very large or very small numbers. Scientific notation shows a small number (less than 10) times 10 raised to a power. For example, the 1984 Gross National Product of the United States was \$3,662,800,000,000. In scientific notation, this is 3.6628×10^{12} . For very small numbers the decimal point is moved to the right and 10 is raised to a negative power. For example, 0.00000752 can be written as 7.52×10^{-6} .

When a calculation produces a result with more than 12 digits, the number is automatically displayed in scientific notation, using a capital E in place of "x10^".

Remember that +/- changes the sign of the entire number, and not of the exponent. Use — to make a negative exponent.

Type in the numbers 4.78×10^{13} and -2.36×10^{-15} .

Keys:	Display:	Description:
4.78 ■ E 13	4.78E13	Pressing E starts the exponent.
CLR DATA	0.00	Clears number.
2.36 E -		Pressing 🖃 before an
15	2.36E-15	exponent makes it negative.
+/-	-2.36E-15	Pressing +/- makes the entire number negative.
CLR DATA		Clears number.

Range of Numbers

The largest positive and negative numbers available on the calculator are ± 9.9999999999 x 10 $^{499};$ the smallest positive and negative numbers available are ± 1 x 10 $^{-499}.$

Percentage Calculations in Business

The business percentages (BUS) menu is used to solve four types of problems. Each type of problem has its own menu.

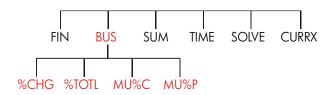

Table 3-1. The Business Percentages (BUS) Menus

Menu	Description
Percent change (*CHG)	The difference between two numbers (OLD and NEW), expressed as a percentage (%CH) of OLD.
Percent of total (%TOTL)	The portion that one number (<i>PART</i>) is of another (<i>TOTAL</i>), expressed as a percentage (% <i>T</i>).
Markup on cost (MU%C)	The difference between price (<i>PRICE</i>) and cost (<i>COST</i>), expressed as a percentage of the cost (<i>M%C</i>).
Markup on price (MU%P))	The difference between price (<i>PRICE</i>) and cost (<i>COST</i>), expressed as a percentage of the price (<i>M%P</i>).

The calculator retains the values of the BUS variables until you clear them by pressing CLR DATA. For example, pressing CLR DATA while in the %CHG menu clears OLD, NEW, and %CH.

To see what value is currently stored in a variable, press RCL menu label. This shows you the value without recalculating it.

Using the BUS Menus

Each of the four BUS menus has three variables. You can calculate any one of the three variables if you know the other two.

 To display the %CHG, %TOTL, MU%C, or MU%P menu from the MAIN menu, press BUS , then the appropriate menu label. Pressing *CHG , for example, displays:

- Store each value you know by keying in the number and pressing the appropriate menu key.
- **3.** Press the menu key for the value you want to calculate.

Examples Using the BUS Menus

Percent Change (%CHG)

Example. Total sales last year were \$90,000. This year, sales were \$95,000. What is the percent change between last year's sales and this year's?

Keys:Display:Description:BUS*CHGDisplays %CHG menu.

50 3: Percentage Calculations in Business

90000	OLD	OLD=90,000.00	Stores 90,000 in <i>OLD</i> .
95000	NEM	NEW=95,000.00	Stores 95,000 in NEW.
2CH		%CHANGE=5.56	Calculates percent
			chanae.

What would this year's sales have to be to show a 12% increase from last year? *OLD* remains 90,000, so you don't have to key it in again. Just enter %CH and ask for NEW.

12 %CH	%CHANGE=12.00	Stores 12 in %CH.
NEW	NEW=100,800.00	Calculates the value 12%
		greater than 90,000.

Percent of Total (%TOTL)

Example. Total assets for your company are \$67,584, The firm has inventories of \$23,457. What percentage of total assets is inventory?

You will be supplying values for *TOTAL* and *PART* and calculating %T. This takes care of all three variables, so there is no need to use CLR DATA to remove old data.

Keys:	Display:	Description:
BUS %TOTL		Displays %TOTL menu.
67584 TOTAL	TOTAL=67,584.00	Stores \$67,584 in <i>TOTAL</i> .
23457 PART	PART=23,457,00	Stores \$23,457 in <i>PART</i> .
λT	%TOTAL=34.71	Calculates percent of
78 I	AFIGURE OF THE	total.

Markup as a Percent of Cost (MU%C)

Example. The standard markup on costume jewelry at Balkis's Boutique is 60%. The boutique just received a shipment of chokers costing \$19.00 each. What is the retail price per choker?

Keys:	Display:	Description:
BUS MU%C		Displays MU%C menu.
19 COST	COST=19.00	Stores cost in COST.
60 MWC	MARKUP%C=60.00	Stores 60% in M%C.
PRICE	PRICE=30.40	Calculates price.

Markup as a Percent of Price (MU%P)

Example. Kilowatt Electronics purchases televisions for \$225, with a discount of 4%. The televisions are sold for \$300. What is the markup of the net cost as a percent of the selling price?

What is the markup as percent of price without the 4% discount?

Keys:	Display:	Description:
BUS MU	%P	Displays MU%P menu.
√ 225 <u></u> − 4 <u></u> 6	%	Calculates and stores net
COST	COST=216.00	cost in COST.
300 PRICE	PRICE=300.00	Stores 300 in PRICE.
M%P	MARKUP%P=28.00	Calculates markup as a
		percent of price.

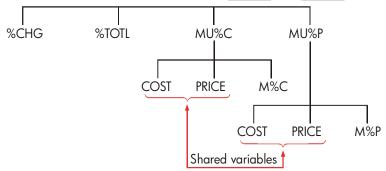

Use \$225 for COST and leave PRICE alone.

225 COST	COST=225.00	Stores 225 in COST.	
M%P	MARKUP%P=25.00	Calculates markup.	

52 3: Percentage Calculations in Business

Sharing Variables Between Menus

If you compare the MU%C menu and the MU%P menus, you'll see that they have two menu labels in common — COST and PRICE.

The calculator keeps track of the values you key in according to those labels. For example, if you key in *COST* and *PRICE* in the MU%C menu, exit to the BUS menu, and then display the MU%P menu, the calculator retains those values. In other words, the variables are *shared* between the two menus.

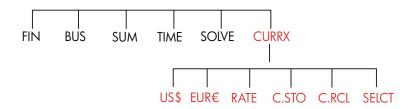

Example: Using Shared Variables. A food cooperative buys cases of canned soup with an invoice cost of \$9.60 per case. If the co-op routinely uses a 15% markup on cost, for what price should it sell a case of soup?

Keys:	Display:	Description:	
BUS MU%C		Displays MU%C menu.	
9.6 COST	COST=9.60	Stores 9.60 in COST.	
15 M‰C	MARKUP%C=15.00	Stores 15% in M%C.	
PRICE	PRICE=11.04	Calculates retail price.	
What is the marks and <i>PRICE</i> .	up on price ? Switch men	us but keep the same COST	
EXIT MUMP		Exits MU%C menu and	
_		displays MU%P menu.	
M%P	MARKUP%P=13.04	Calculates markup as a	
		percent of price.	

Currency Exchange Calculations

The CURRX menu does currency exchange calculations between two currencies using an exchange rate that you calculate or store.

The CURRX Menu

To display the currency exchange menu from the MAIN menu, press $\ensuremath{\text{CURRX}}$.

4: Currency Exchange Calculation

Table 4-1. The CURRX Menu

Menu Key	Description
Curr1	Current <i>currency#1</i> ;stores or calculates the number of units of this currency
Curr2	Currency <i>currency#2</i> ;stores or calculates the number of units of this currency
RATE	Stores or calculates the exchange rate between the two current currencies. The rate is expressed as the number of units of <i>currency #2</i> equivalent to 1 unit of <i>currency #1</i> .
C.STO	Stores the current <i>currency #1</i> , <i>currency #2</i> , and RATE.
C.RCL	Recalls a previously stored pair of currencies and RATE.
SELCT	Selects a new set of currencies.

Selecting a Set of Currencies

To select a pair of currencies:

- **1.** Press <u>SELCT</u> to display the menu of currencies. Press more, if necessary, to see additional currencies (see table 4–2).
- **2.** Press a menu key to select *currency #1*.
- **3.** Press a menu key to select *currency #2*. RATE is automatically reset to 1.0000.
- 4. Enter an exchange rate. There are two ways enter the RATE:
- Calculate the rate from a known equivalency (see the example "Calculating an Exchange Rate," page 57.). Calculating an exchange rate is usually the easier way to enter a correct rate, since the order in which you selected the two currencies doesn't mater.
- Store the exchange rate by keying in the value and pressing RATE (see "Storing an Exchange Rate" on page 58).

Table 4-2. Currencies

US\$ United States of America (Dollars)	EUR€ Austria, Belgium, Germany, Spain, Finland, France,	Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Vatican City (EURO)	CAN\$ Canada (Dollars)	UK£ United Kingdom (Pounds)
SF	NIS	D.KR	N.KR	S.KR

* Use for curre	ncies not show	n in table		

56

Entering a Rate

The following two examples illustrate the two ways to enter an exchange rate.

Example: Calculating an Exchange Rate. You have just flown from Canada to United States, and you need to exchange your Canadian Dollars for U.S Dollars. The conversion chart looks this:

United States Conversion Chart (in US\$)		
Currency	Rate	
Euro (EUR€)	1.0842	
Canadian (CAN\$)	.6584	
Hong Kong (HK\$)	.1282	

The chart states these equivalencies: *

1 EU <i>R</i> €	is equivalent to	1.0842	US\$
1 CAN\$	is equivalent to	0.6584	US\$
1 <i>HK</i> \$	is equivalent to	0.1282	US\$

Part 1: Select the currencies, and calculate an exchange rate form them.

Keys:		Display:	Description:
CURRX		ENTER A RATE	Display the CURRX menu
SELCT	CAN\$	SELECT CURRENCY 2	Select CAN\$ as currency
			#1
US\$		ENTER A RATE	Select US\$ as currency #2
] CRN\$		CAN\$=1.00	Store number of CAN\$

^{*} The chart is in terms of United States dollars. Many charts have two columns—a "Buy" column and a "Sell" column. The "Buy" column is used for transactions in which the "Bank" buys the listed currency from you in exchange for United States dollars. Thus, if you arrive in United States with CAN\$, the exchange rate in the "Buy" column applies for buying US\$ with your CAN\$. The "Sell" column applies for selling US\$ in exchange for CAN\$.

0.6584 US\$ US\$=0.66 Stores equivalent number of US\$

RATE RATE=0.66 Calculates the RATE.

Part 2: The following keystrokes show that you can reverse the order in which the two currencies are selected.

Keys:		Display:	Description:
SELCT	US\$	SELECT CURRENCY 2	Select US\$ as currency #1
CAN\$		ENTER A RATE	Select CAN\$ as currency #2
] CAN\$		CAN\$=1.00	Store number of CAN\$
0.6584	US\$	US\$=0.66	Stores equivalent number of <i>US\$</i>
RATE		RATE=1.52	Calculates the <i>RATE</i> . (1 ÷ 0.6584)
			(1 . 0.000+)

Example : Storing an Exchange Rate. If you choose to store the exchange rate directly, you must select the currencies in the correct order, since the *RATE* is defined as the number of units of *currency #2* equivalent to **one** unit of *currency#1*

Use the United States conversion chart on page 57 to store an exchange rate for converting between Hong Kong Dollars and U.S. Dollars.

Keys:		Display:	Description:
CURRX		ENTER A RATE	Display the CURRX menu
SELCT	MORE		Select HK\$ as currency
MORE	MORE		#1
HK\$		SELECT CURRENCY 2	
US\$		ENTER A RATE	Select US\$ as currency #2
0.1282	RATE	RATE=0.13	Store the RATE

4: Currency Exchange Calculation

58

Converting Between Two Currencies

Once the currencies are selected and a *RATE* has been entered, you can convert any number of units of one currency to the other.

Example: Converting between Hong Kong and U.S Dollars.

Part 1: Use the exchange rate stored in the previous example to calculate how many U.S dollars you would receive for 3,000 Hong Kong Dollars.

Keys:	Display:	Description:
3000 HK\$	HK\$=3,000.00	Store number of HK\$
US\$	US\$=384.60	Calculates equivalent US\$

Part 2: A wool sweater in a shop window costs 75 US\$. What is its cost in HK\$ Dollars?

Keys:	Display:	Description:
75 US\$	US\$=75.00	Store number of US\$
HK\$	HK\$=585.02	Calculates equivalent HK\$

Storing and Recalling Sets of Currencies

Pressing C.STO or C.RCL displays the C.STO/C.RCL menu, which is used to store and recall sets of currencies and the rates. The menu can store up to six sets of currencies. Initially, the menu contains six blank labels.

Storing Sets of Currencies. To store the current set of currencies and the rate, press. Then, press C.\$T0 any menu key to assign the set to that key. For example, storing the currencies in the previous example stores currency #1 = HK\$, currency #2 = US\$, and RATE = 0.1282. (The values US\$ = 75 and HK\$ = 585.02 are not stored.)

Recalling Sets of Currencies. To recall a stored set of currencies and their exchange rate, press C.RCL , followed by the appropriate menu key. The hp 17bll+ automatically returns to the CURRX menu. The equivalency message and menu labels show the recalled currencies and *RATE*.

Clearing the Currency Variables

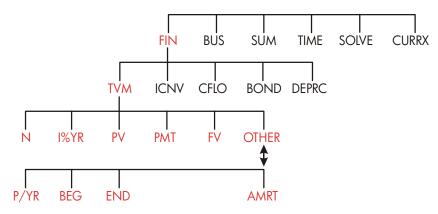

Pressing CLRDATA while the CURRX menu is displayed sets the RATE to 1.0000. The values of the two current currencies are cleared to 0.

Time Value of Money

The phrase *time value of money* describes calculations based on money earning interest over a period of time. The TVM menu performs compound-interest calculations and calculates (and prints) amortization schedules.

- In compound interest calculations, interest is added to the principal at specified compounding periods, thereby also earning interest. Savings accounts, mortgages, and leases are compound-interest calculations.
- In *simple interest* calculations, the interest is a percent of the principal and is repaid in one lump sum. Simple interest calculations can be done using the % key (page 40). For an example that calculates simple interest using an annual interest rate, see page 190.

The TVM Menu

The time value of money (TVM) menu does many compound-interest calculations. Specifically, you can use the TVM menu for a series of *cash flows* (money received or money paid) when:

- The dollar amount is the same for each payment.*
- The payments occur at regular intervals.
- The payment periods coincide with the compounding periods.

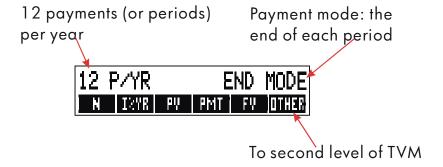

Figure 5-1. The First Level of TVM

The first level of the TVM menu has five menu labels for variables plus OTHER. The OTHER key accesses a second-level menu used to specify payment conditions (the *payment mode*) and to call up the AMRT (*amortization*) menu.

Figure 5-2. The Second Level of TVM

62 5: Time Value of Money

^{*} For situations where the amount of the payment varies, use the CFLO (cash flows) menu.

Table 5-1. TVM Menu Labels

Menu Label	Description
	First Level
N	Stores (or calculates) the <i>total</i> number of payments or compounding periods. * \dagger (For a 30-year loan with monthly payments, $N=12 \times 30=360$.)
N	Shortcut for N: Multiplies the number in the display by P/YR , and stores the result in N. (If P/YR were 12, then
I%YR	30 N would set N=360.) Stores (or calculates) the nominal <i>annual</i> interest rate as a percentage.
PV	Stores (or calculates) the present value—an initial cash flow or a discounted value of a series of future cash flows (<i>PMTs</i> + <i>FV</i>). To a lender or borrower, <i>PV</i> is the amount of the loan; to an investor, <i>PV</i> is the initial investment. If <i>PV</i> paid out, it is negative. <i>PV</i> always occurs at the beginning of the first period.
PMT	Stores (or calculates) the dollar amount of each periodic payment. All payments are equal, and no payments are skipped. (If the payments are unequal, use CFLO, not TVM.) Payments can occur at the beginning or end of each period. If PMT represents money paid out, it is negative.
FV	Stores (or calculates) the future value—a final cash flow or a compounded value of a series of previous cash flows (PV + PMTs). FV always occurs at the end of the last period. If FV is paid out, it is negative.
	OTHER EXIT
	Second Level
P/YR	Specifies the number of payments or compounding periods per year.† (it must be an integer, 1 through 999.)
ale a cont	

^{*} When a non-integer N (an "odd period") is calculated, the answer must be interpreted carefully. See the savings account example on page 71. Calculations using a stored, non-integer N produce a mathematically correct result, but this result has no simple interpretation. The example on page 172 uses the Solver to do a partial-period (non-integer) calculation in which interest begins to accrue prior to the beginning of the first regular payment period.

† The number of payment periods must equal the number of compounding periods. If this is not true, see page 87. For Canadian mortgages, see page 197.

Table 5-1. TVM Menu Labels (Continued)

Menu Label	Description
	Second Level (Continued)
BEG	Sets Begin mode: payments occur at the beginning of each period. Typical for savings plans and leasing. (The Begin and End modes do not matter if PMT=0.)
END	Sets <i>End mode</i> : payments occur at the end of each period. Typical for loans and investments.
AMRT	Accesses the amortization menu. See page 78.

The calculator retains the values of the TVM variables until you clear them by pressing CLRDATA. When you see the first-level TVM menu, pressing CLRDATA clears N, 18YR, PV, PMT, and FV.

When the second-level menu (OTHER) is displayed, pressing CLRDATA resets the payment conditions to 12 PYR END MODE.

To see what value is currently stored in a variable, press RCL menu label. This shows you the value without recalculating it.

Cash Flow Diagrams and Signs of Numbers

It is helpful to illustrate TVM calculations with *cash-flow diagrams*. Cash-flow diagrams are time lines divided into equal segments called *compounding* (or *payment*) *periods*. Arrows show the occurrence of cash flows (payments in or out). Money received is a positive number (arrow up) and money paid out is a negative number (arrow down).

The correct sign (positive or negative) for TVM numbers is essential. The calculations will make sense only if you consistently show payments out as negative and payments in

(receipts) as *positive*. Perform a calculation from the point of view of *either* the lender (investor) or the borrower, but not both!

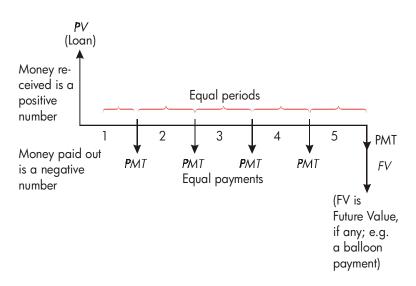

Figure 5-3. A Cash Flow Diagram for a Loan from Borrower's Point of View (End Mode)

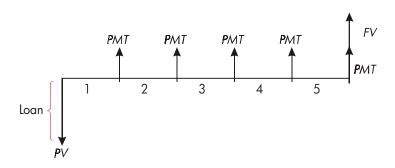

Figure 5-4. A Cash Flow Diagram for a Loan from Lender's Point of View (End Mode)

Payments occur at either the *beginning* of each period or the *end* of each period. End mode is shown in the last two figures; Begin mode is shown in the next figure.

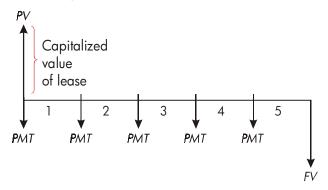

Figure 5-5. Lease Payments Made at the Beginning of Each Period (Begin Mode)

Using the TVM Menu

First draw a cash-flow diagram to match your problem. Then:

- 1. From the MAIN menu, press FIN TVM
- 2. To clear previous TVM values, press CLR DATA, (Note: You don't need to clear data if you enter new values for all five variables, or if you want to retain previous values.)
- 3. Read the message that describes the number of payments per year and the payment mode (Begin, End). If you need to change either of these settings, press OTHER.
 - To change the number of payments per year, key in the new value and press PYR. (If the number of payments is different from the number of compounding periods, see "Compounding Periods Different from Payment Periods," page 87.)
 - To change the Begin/End mode, press BEG or END
 - Press EXIT to return to the primary TVM menu.

66 5: Time Value of Money

- **4.** Store the values you know. (Enter each number and press its menu key.)
- **5.** To calculate a value, press the appropriate menu key.

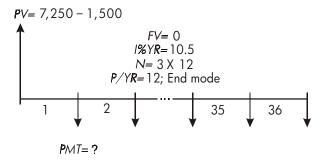

You must give every variable—except the one you will calculate—a value, even if that value is zero. For example, FV must be set to zero when you are calculating the periodic payment (PMT) required to fully pay back a loan. There are two ways to set values to zero:

- Before storing any TVM values, press ☐ CLR DATA to clear the previous TVM values.
- Store zero; for example, pressing 0 FV sets FV to zero.

Loan Calculations

Three examples illustrate common loan calculations. (For amortization of loan payments, see page 77.) Loan calculations typically use End mode for payments.

Example:A Car Loan. You are financing the purchase of a new car with a 3-year loan at 10.5% annual interest, compounded monthly. The purchase price of the car is \$7,250. Your down payment is \$1,500. What are your monthly payments? (Assume payments start one month after purchase — in other words, at the end of the first period.) What interest rate would reduce your monthly payment by \$10?

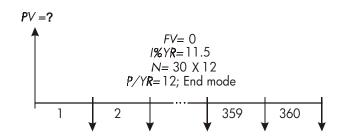

Keys:	Display:	Description:
FIN TVM		Displays TVM menu.
CLR DATA	12 P/YR END MODE	Clears history stack and
		TVM variables.
OTHER		If needed: sets 12
CLR DATA		payment periods per year;
EXIT	12 P/YR END MODE	End mode.
√ 3 × 12		Figures and stores number
N	N=36.00	of payments.
10.5 I%YR	I%YR=10.50	Stores annual interest rate.
√ 7250 <u></u> 1500		Stores amount of the loan.
PV	PV=5,750.00	
PMT	PMT=-186.89	Calculates payment.
		Negative value means
		money to be paid out.

To calculate the interest rate that reduces the payment by \$10, add 10 to reduce the negative *PMT* value.

√ + 10 PMT	PMT=-176.89	Stores the reduced
		payment amount.
I%YR	I%YR=6.75	Calculates the annual
		interest rate.

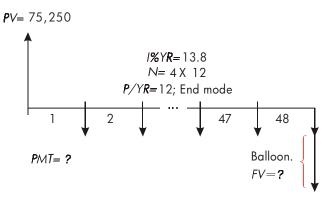

Example: A Home Mortgage. After careful consideration of your personal finances, you've decided that the maximum monthly mortgage payment you can afford is \$630. You can make a \$12,000 down payment, and annual interest rates are currently 11.5%. If you take out a 30-year mortgage, what is the maximum purchase price you can afford?

PMT = -630

Keys:	Display:	Description:
FIN TVM ☐ (CLR DATA)	12 P/YR END MODE	Display TVM menu. Clears history stack and TVM variables.
OTHER CLR DATA	12 P/YR END MODE	If needed: sets 12 payment periods per year; End mode.
30 🔲 н	N=360.00	Pressing first multiplies 30 by 12, then stores this number of payments in <i>N</i> .
11.5 IXYR 630 +/-	I%YR=11.50 PMT=-630.00	Stores annual interest rate. Stores a <i>negative</i> monthly
PMT	PV=63,617.64	payment. Calculates loan amount.
√ + 12000 =	75,617.64	Calculates total price of the house (loan plus down payment).

Example: A Mortgage with a Balloon Payment. You've taken out a 25-year, \$75,250 mortgage at 13.8% annual interest. You anticipate that you will own the house for four years and then sell it, repaying the loan in a "balloon payment." What will be the size of your balloon payment?

The problem is done in two steps:

- 1. Calculate the monthly payment without the balloon (FV=0).
- 2. Calculate the balloon payment after 4 years.

Keys:	Display:	Description:
FIN TVM	12 P/YR END MODE	Display TVM menu. Clears history stack and
CEIDINI		TVM variables.
OTHER CLR DATA		If needed: sets 12 payment
EXIT	12 P/YR END MODE	periods per year; End
		mode.

Step 1. Calculate *PMT* for the mortgage.

25 🔲 Ν	N=300.00	Figures and stores the
		number of monthly
		payments in 25 years.
13.8 I%YR	I%YR=13.80	Stores annual interest rate.
75250 PV	PV=75,250.00	Stores amount of the loan.
PMT	PMT=-894.33	Calculates monthly
		payment.

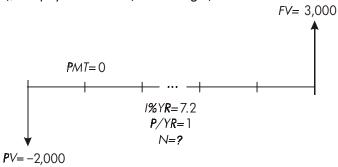

70 5: Time Value of Money

Step 2. Calculate the balloon payment after 4 years.

894.33 +/-		Stores rounded PMT value
PMT	PMT=-894.33	for exact payment amount
		(no fractional cents).*
4 🔲 N	N=48.00	Figures and stores number
		of payments in 4 years.
FV	PV=-73,408.81	Calculates balloon payment
		after four years. This
		amount plus last monthly
		payment repays the loan.

Savings Calculations

Example: A Savings Account. You deposit \$2,000 into a savings account that pays 7.2% annual interest, compounded annually. If you make no other deposits into the account, how long will it take for the account to grow to \$3,000? Since this account has no regular payments (*PMT*=0), the payment mode (End or Begin) is irrelevant.

^{*} The *PMT* stored in the previous step is the 12-digit number –894.330557971. The calculation of the balloon payment must use the actual monthly payment amount: the rounded number \$894.33, an exact dollars-and-cents amount.

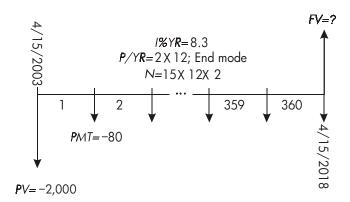

Keys:	Display:	Description:
FIN TVM		Displays TVM menu.
CLR DATA	12 P/YR END MODE	Clears history stack and
		TVM variables.
OTHER		Sets one compounding
1 P/YR		per./yr. (one interest
EXIT	1 P/YR END MODE	pmt./yr.). Payment mode
		does not matter.
7.2 I%YR	I%YR=7.20	Stores annual interest rate.
2000 +/- PV	PV=-2,000.00	Stores amount of deposit.
3000 FV	FV=3,000.00	Stores future account
		balance in FV.
N	N=5.83	Calculates number of compounding periods (years) for the account to reach \$3,000.

There is no conventional way to interpret results based on a non-integer value (5.83) of N. Since the calculated value of N is between 5 and 6, it will take 6 years of annual compounding to achieve a balance of at least \$3,000. The actual balance at the end of 6 years can be calculated as follows:

6 н	N=6.00	Stores a whole number of
		years in N.
FV	FV=3,035,28	Calculates account balance
		after six years.

Example: An Individual Retirement Account (IRA). You opened an IRA on April 15, 2003, with a deposit of \$2,000. Thereafter, you deposit \$80.00 into the account at the end of each half-month. The account pays 8.3% annual interest, compounded semimonthly. How much money will the account contain on April 15, 2018?

72 5: Time Value of Money

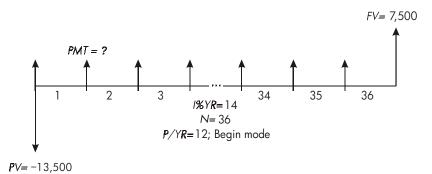

Display:	Description:
	Displays TVM menu. It is
	not necessary to clear data
	because you do not need to
	set any of the values to
	zero.
	Sets 24 payment periods
	per year. End mode.
24 P/YR END MODE	
N=360.00	Figures and stores number
	of deposits in N.
I%YR=8.30	Stores annual interest rate.
PV=-2,000.00	Stores initial deposit.
PMT=-80.00	Stores semimonthly
	payment.
FV=63,963.84	Calculates balance in IRA
	after 15 years.
	24 P/YR END MODE N=360.00 I%YR=8.30 PV=-2.000.00 PMT=-80.00

Leasing Calculations

Two common leasing calculations are 1) finding the lease payment necessary to achieve a specified yield, and 2) finding the present value (capitalized value) of a lease. Leasing calculations typically use "advance payments". For the calculator, this means Begin mode because all payments will be made at the beginning of the period. If there are two payments in advance, then one payment must be combined with the present value. For examples with two or more advance payments, see pages 75 and 199.

Example: Calculating a Lease Payment. A new car valued at \$13,500 is to be leased for 3 years. The lessee has the option to purchase the car for \$7,500 at the end of the leasing period. What monthly payments, with one payment in advance, are necessary to yield the lessor 14% annually? Calculate the payments from the lessor's point of view. Use Begin payment mode because the first payment is due at the inception of the lease.

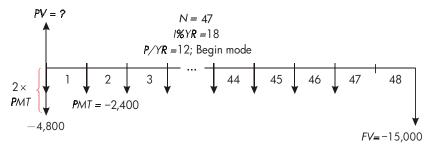

Keys:	Display:	Description:
FIN TVM		Displays TVM menu.
OTHER		Sets 12 payment periods
12 P/YR		per year, Begin mode.
BEG EXIT	12 P/YR BEGIN	
	MODE	
36 N	N=36.00	Stores number of payments.

74 5: Time Value of Money

14 I%YR	I%YR=14.00	Stores annual interest rate.
13500 +/-		Stores car's value in PV.
PV	PV=-13,500.00	(Money paid out by lessor.)
7500 FV	FV=7,500.00	Stores purchase option
		value in FV. (Money
		received by lessor.)
PMT	PMT=289.19	Calculates monthly payment
		received.

Example: Present Value of a Lease with Advance Payments and Option to Buy. Your company is leasing a machine for 4 years. Monthly payments are \$2,400 with two payments in advance. You have an option to buy the machine for \$15,000 at the end of the leasing period. What is the capitalized value of the lease? The interest rate you pay to borrow funds is 18%, compounded monthly.

The problem is done in four steps:

- **1.** Calculate the present value of 47 monthly payments in Begin mode. (Begin mode makes the first payment an advance payment.)
- Add one additional payment to the calculated present value. This adds a second advance payment to the beginning of the leasing period, replacing what would have been the final (48th) payment.
- 3. Find the present value of the buy option.
- **4.** Add the present values calculated in steps 2 and 3.

Keys:	Display:	Description:
FIN TVM		Displays TVM menu.
CLR DATA	12 P/YR END MODE	Clears history stack and
		TVM variables.
OTHER		Sets 12 payment periods
12 P/YR		per year; Begin mode.
BEG EXIT	12 P/YR BEGIN	
	MODE	

Step 1: Find the present value of the monthly payments.

47 N		N=47.00	Stores number of payments.
18 I%YR		I%YR=18.00	Stores annual interest rate.
2400 +/-	PMT	PMT=-2,400.00	Stores monthly payment.
PV		PV=81,735.58	Calculates present
			(capitalized) value of the
			47 monthly payments.

Step 2: Add the additional advance payment to *PV*. Store the answer.

√ + 2400 =	84,135.58	Calculates present value of
		all payments.
STO 0	84,135.58	Stores result in register 0.

Step 3: Find the present value of the buy option.

48 N	N=48.00	Stores number of payment
		periods.
15000 +/-		Stores amount of the buy
FV	FV=-15,000.00	option (money paid out).
O PMT	PMT=0.00	There are no payments.

76 5: Time Value of Money

PV PV=7,340,43

Calculates present value of the buy option.

Step 4: Add the results of step 2 and 3.

91,476,00

Calculates present, capitalized value of lease.

Amortization (AMRT)

The AMRT menu (press TVM OTHER AMRT) displays or prints the following values:

- The loan balance after the payment(s) are made.
- The amount of the payment(s) applied toward interest.
- The amount of the payment(s) applied toward principal.

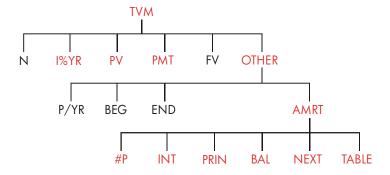

Table 5-2. AMRT Menu Labels

Menu Label	Description
#P	Stores the number of payments to be amortized, and calculates an amortization schedule for that many payments. Successive schedules start where the last schedule left off. #P can be an integer from 1 through 1,200.
INT	Displays the amount of the payments applied toward interest.
PRIN	Displays the amount of the payments applied toward principal.
BAL	Displays the balance of the loan.
NEXT	Calculates the next amortization schedule, which contains #P payments. The next set of payments starts whe re the previous set left off.
TABLE	Displays a menu for printing an amortization table (schedule).

Displaying an Amortization Schedule

For amortization calculations, you need to know *PV*, *1%YR*, and *PMT*. If you have just finished doing these calculations with the TVM menu, then skip to step 3.

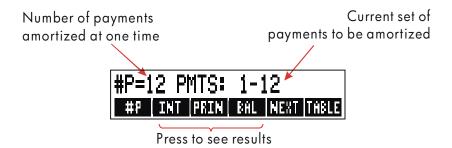

To calculate and display an amortization schedule:*

1. Press FIN TVM to display the TVM menu.

78 5: Time Value of Money

^{*} Amortization calculations use values of *PV*, *PMT*, and *INT* rounded to the number of decimal places specified by the current display setting. A setting of 2 means that these calculations will be rounded to two decimal places.

- 2. Store the values for I%YR, PV, and PMT. (Press +- to make PMT a negative number.) If you need to calculate one of these values, follow the instructions under "Using the TVM Menu," on page 66. Then go on to step 3.
- **3.** Press OTHER to display the rest of the TVM menu.
- **4.** If necessary, change the number of payment periods per year stored in PYR.
- If necessary, change the payment mode by pressing BEG or END. (Most loan calculations use End mode.)
- **6.** Press AMRT . (If you want to *print* the amortization schedule, go to page 82 to continue.)
- 7. Key in the number of payments to be amortized at one time and press #P . For example, to see a year of monthly payments at one time, set #P to 12. To amortize the entire life of a loan at one time, set #P equal to the total number of payments (N). If #P = 12, the display would show:

- **8.**To display the results, press, INT , PRIN and BAL (or press ▼ to view the results from the stack).
- To continue calculating the schedule for subsequent payments, do a
 or b. To start the schedule over, do c.
 - **a.** To calculate the next *successive* amortization schedule, with the same number of payments, press №EXT .

Next successive set of payments authorized

- **b.** To calculate a subsequent schedule with a *different* number of payments, key in that number and press #P.
- c. To start over from payment #1 (using the same loan information), press ☐ CLR DATA and proceed from step 7.

Example: Displaying an Amortization Schedule. To purchase your new home, you have taken out a 30-year, \$65,000 mortgage at 12.5% annual interest. Your monthly payment is \$693.72. Calculate the amount of the first year's and second year's payments that are applied toward principal and interest.

Then calculate the loan balance after 42 payments ($3\frac{1}{2}$ years).

Keys:	Display:	Description:
FIN TVM		Displays TVM menu.
12.5 IMYR	I%YR=12.50	Stores annual interest rate.
65000 PV	PV=65,000.00	Stores loan amount.
693.72 +/- PMT	PMT=-693.72	Stores monthly payment.
OTHER		If needed: sets 12
CLR DATA	12 P/YR END MODE	payment periods per year; End mode.
AMRT	KEY #PMTS; PRESS {#P}	Displays AMRT menu.
12 #P	#P=12 PMTS: 1-12	Calculates amortization schedule for first 12

80 5: Time Value of Money

payments, but does not
display it.
⁶ Displays interest paid in

first year.
PRINCIPAL=-211.48 Displays principal paid in

first year.

BALANCE=64,788,52 Displays balance at end

of first year.

schedule for next 12

payments.

INTEREST=-8,085,15Displays results for

INTEREST=-8,113.1

second year.

PRIN PRINCIPAL=-239.49
BAL BALANCE=64,549.03

INT

PRIN

BAL

To calculate the balance after 42 payments ($3\frac{1}{2}$ years), amortize 18 additional payments (42-24=18):

18 #P #P=18 PMTS: 25-42 Calculates amortization

schedule for next 18

months.

INT INTEREST = Displays results.

-12,066.98

PRIN PRINCIPAL=-419.98
BAL BALANCE=64,129.05

Printing an Amortization Table (TABLE)

To print an amortization schedule (or "table") do steps 1 through 5 for displaying an amortization schedule (see page 78).

- **6.** Press AMRT Ignore the message KEY #PMTS; PRESS (#P).
- 7. Press TABLE.
- **8.** Key in the payment number of the first payment in the schedule and press FIRST. (For instance, for the very first payment, FIRST= 1.)
- **9.** Key in the payment number of the last payment in the schedule and press LAST.
- **10.** Key in the increment the number of payments shown at one time—and press INCR . (For instance, for one year of monthly payments at a time, INCR=12.)
- **11**.Press GO

Values are retained until you exit the TABLE menu, so you can print successive amortization schedules by re-entering only those TABLE values that change.

Example: Printing an Amortization Schedule. For the loan described in the previous example (page 80), print an amortization table with entries for the fifth and sixth years. You can continue from the AMRT menu in the previous example (step 7, above) or repeat steps 1 through 6.

Starting from the AMRT menu:

Keys:	Display:	Description:
TABLE	PRINT AMORT TABLE	Displays menu for printing amortization table.
√ 4 × 12 + 1 FIRST	FIRST=49.00	The 49th is the first payment in year 5.
√ 6 ⊠ 12 LAST	LAST=72.00	The 72nd is the last payment in year 6.
12 INCR	INCR=12.00	Each table entry represents 12 payments

82 5: Time Value of Money

Interest Rate Conversions

The interest conversion (ICNV) menu converts between nominal and effective interest rates. To compare investments with different compounding periods, their *nominal interest rates* are converted to *effective interest rates*. This allows you, for example, to compare a savings account that pays interest quarterly with a bond that pays interest semiannually.

- The nominal rate is the stated annual interest rate compounded periodically, such as 18% per year compounded monthly.
- The effective rate is the rate that, compounded only once (that is, annually), would produce the same final value as the nominal rate. A nominal annual rate of 18% compounded monthly equals an effective annual rate of 19.56%.

When the compounding period for a given nominal rate is one year, then that nominal annual rate is the same as its effective annual rate.

The ICNV Menu

The ICNV menu converts between nominal and effective interest rates, using either:

- Periodic compounding; for example, quarterly, monthly, or daily compounding.
- Continuous compounding.

Converting Interest Rates

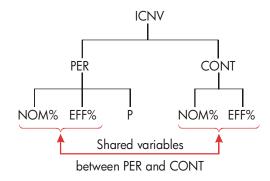

To convert between a nominal annual interest rate and an effective annual interest rate that is compounded *periodically*:

- 1. Press FIN ICNV to display the interest conversions menu.
- **2.** Press PER for periodic.
- **3.** Key in the number of compounding periods per year and press P.
- **4.** To convert to the effective rate, first key in the nominal rate and press NOM2, then press EFF%.
- **5.** To convert to the nominal rate, first key in the effective rate and press EFF%, then press NOM%.

To convert between a nominal annual interest rate and an effective annual interest rate that is compounded *continuously:*

- 1. Press FIN ICNV to get the interest conversions menu.
- 2. Press CONT for "continuous".
- **3.** To convert to the effective rate, key in the nominal rate and press NOM2, then press EFF%.
- **4.** To convert to the nominal rate, key in the effective rate and press EFF%, then press NOM%.

Values of *EFF*% and *NOM*% are shared between the PER and CONT menus. For example, an effective interest rate in CONT remains stored in *EFF*% when you exit the CONT menu and enter the PER menu. Pressing CLR DATA in either menu clears *NOM*% and *EFF*% in both.

Example: Converting from a Nominal to an Effective Interest Rate.

You are considering opening a savings account in one of three banks. Which bank has the most favorable interest rate?

Bank #1 6.7% annual interest, compounded quarterly.
Bank #2 6.65% annual interest, compounded monthly.
Bank #3 6.65% annual interest, compounded continuously.

Keys:		Display:	Description:
FIN	ICNV		Displays ICNV menu.
PER		COMPOUNDING P	Displays PER menu.
		TIMES/YP	

86 6: Interest Rate Conversions

4 P	P=4.00	Stores number of compounding periods per year for bank #1.
6.7 NOM%	NOM%=6.70	Stores nominal annual interest rate for bank #1.
EFF%	EFF%=6.87	Calculates effective interest rate for bank #1.
12 P	P=12.00	Stores number of compounding periods per year for bank #2.
6.65 NOM%	NOM%=6.65	Stores nominal annual interest rate for bank #2.
EFF%	EFF%=6.86	Calculates effective interest rate for bank #2.
EXIT CONT	CONTINUOUS COMPOUNDING	Displays CONT menu. Previous values of NOM% and EFF% are retained.
EFF%	EFF%=6.88	Calculates effective rate for bank #3.

The calculations show that bank #3 is offering the most favorable interest rate.

Compounding Periods Different from Payment Periods

The TVM menu assumes that the compounding periods and the payment periods are the same. However, regularly occurring savings- account deposits and withdrawals do not necessarily occur at the same time as the bank's compounding periods. If they are not the same, you can adjust the interest rate using the ICNV menu, and then use the adjusted

interest rate in the TVM menu. (You can also use TVM if PMT = 0, regardless of the compounding periods.)

- 1. Call up the periodic interest-rate conversion menu (FIN ICNV PER).
- 2. Calculate the effective annual interest rate from the nominal annual interest rate given by the bank.
 - a. Store annual interest rate in NOM.
 - **b.** Store number of compounding periods per year in P
 - c. Press EFF%.
- Calculate the nominal annual interest rate that corresponds to your payment periods.
 - **a.** Store the number of regular payments or withdrawals you will be making per year in P.
 - **b.** Press NOM%.
- 4. Return to the TVM menu (EXIT) EXIT TVM).
- **5.** Store the just-calculated nominal interest rate in *1%YR* (press <u>STO</u> IXYR).
- **6.** Store the number of payments or withdrawals per year in PYR and set the appropriate payment mode.
- Continue with the TVM calculation. (Remember that money paid out is negative; money received is positive.)
 - **a.** N is the total number of periodic deposits or withdrawals.
 - **b.** PV is the initial deposit.
 - **c.** *PMT* is the amount of the regular, periodic deposit or withdrawal.
 - **d.** FV is the future value.

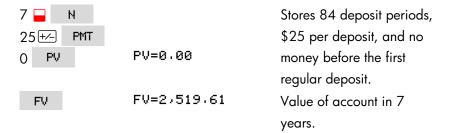

When the interest rate is the unknown variable, first calculate *1%YR* in the TVM menu. This is the nominal annual rate that corresponds to your payment periods. Next, use the ICNV menu to convert this to the

88 6: Interest Rate Conversions

effective interest rate based on your payment periods. Last, convert the effective rate to the nominal rate based on the bank's compounding periods.

Example: Balance of a Savings Account. Starting today, you make monthly deposits of \$25 into an account paying 5% interest compounded daily (365-day basis). At the end of 7 years, how much will you receive from the account?

Keys:	Display:	Description:
FIN ICNV	SELECT	
	COMPOUNDING	
PER	COMPOUNDING P	Periodic interest-rate
	TIMES/YR	conversion menu.
365 P	P=365.00	Stores bank's
		compounding periods.
5 NOM%	NOM%=5.00	Stores bank's nominal
		interest rate.
EFF%	EFF%=5.13	Calculates effective interest
		rate for daily compounding.
12 P	P=12.00	Stores number of deposits
		per year.
NOM%	NOM%=5.01	Calculates equivalent
		nominal interest rate for
		monthly compounding.
EXIT EXIT	= 6.	Switches to TVM menu;
TVM (5.01	NOM% value is still in
		calculator line.
STO IXYR	I%YR=5.01	Stores adjusted nominal
		interest rate in <i>1%YR</i> .
OTHER 12 P/YR	400 400000	Sets 12 payments per
BEG EXIT	12 P/YR BEGIN MODE	year; Begin mode.

If the interest rate were the unknown, you would first do the TVM calculation to get I%YR (5.01). Then, in the ICNV PER menu, store 5.01 as NOM% and 12 as P for monthly compounding. Calculate EFF% (5.13). Then change P to 365 for daily compounding and calculate NOM% (5.00). This is the bank's rate.

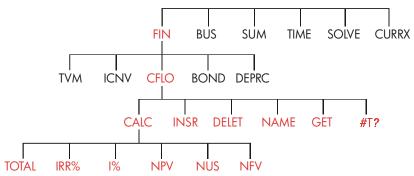

Cash Flow Calculations

The cash flow (CFLO) menu stores and analyzes cash flows (money received or paid out) of *unequal* (*ungrouped*) amounts that occur at regular intervals.* Once you've entered the cash flows into a *list*, you can calculate:

- The total amount of the cash flows.
- The internal rate of return (IRR%).
- The net present value (NPV), net uniform series (NUS), and net future value (NFV) for a specified periodic interest rate (1%).

You can store many separate lists of cash flows. The maximum number depends on the amount of available calculator memory.

The CFLO menu

The CFLO menu creates cash-flow lists and performs calculations with a list of cash flows.

^{*} You can also use CFLO with cash flows of *equal* amounts, but these are usually handled more easily by the TVM menu.

Table 7-1. CFLO Menu Labels

Menu Label	Description
CALC	Accesses the CALC menu to calculate TOTAL, IRR%, NPV, NUS, NFV.
INSR	Allows you to insert cash flows into a list.
DELET	Deletes cash flows from a list.
NAME	Allows you to name a list.
GET	Allows you to switch from one list to another or create a new list.
#T?	Turns the prompting for #TIMES on and off.

To see the calculator line when this menu is in the display, press INPUT once. (This does not affect number entry.)

To see this menu when the calculator line is in the display, press **EXIT**.

Cash Flow Diagrams and Signs of Numbers

The sign conventions used for cash flow calculations are the same as those used in time-value-of-money calculations. A typical series of cash flows is one of two types:

■ Ungrouped cash flows. These occur in series of cash flows without "groups" of equal, consecutive flows.* Because each flow is different from the one before it, the number of times each flow occurs is one.

^{*} Any cash flow series can be treated as an ungrouped one if you enter each flow individually.

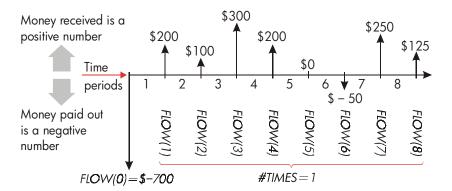

Figure 7-1. Cash Flows (Ungrouped)

The horizontal timeline is divided into equal compounding periods. The vertical lines represent the cash flows. For money received, the line points up (positive); for money paid out, the line points down (negative). In this case, the investor has invested \$700. This investment has generated a series of cash flows, starting at the end of the first period. Notice that there is no cash flow (a cash flow of zero) for period five, and that the investor pays a small amount in period six.

Grouped cash flows. These occur in a series containing "groups" of equal, consecutive flows. Consecutive, equal cash flows are called grouped cash flows. The series shown here is grouped into two sets of consecutive, equal cash flows:

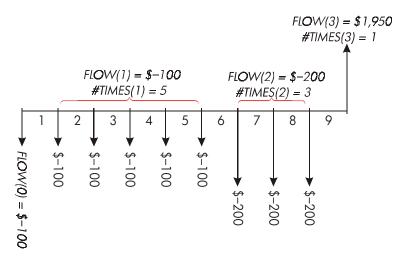

Figure 7-2. Grouped Cash Flows

After an initial payment of \$100, the investor pays \$100 at the end of periods 1 through 5, and \$200 at the end of periods 6 through 8. The investment returns \$1,950 at the end of period 9. For every cash flow you enter, the calculator prompts you to indicate how many times (#TIMES) it occurs.

Creating a Cash-Flow List

To use CFLO, be sure your cash flows are occurring at regular intervals and at the *end* of each period.* If a period is skipped, enter zero for its cash flow. If there are any *grouped* (consecutive and equal) cash flows, the *#TIMES* prompting makes entering the data easier.

94 7: Cash Flow Calculations

^{*} If the cash flows occur at the beginning of each period, then combine the first flow with the initial flow (which can increase or decrease the flow), and move each cash flow up one period. (Remember: a payment made at the beginning of period 2 is equivalent to the same payment made at the end of period 1 and so on. Refer to pages 64-92.)

Entering Cash Flows

To enter cash flows into a CFLO list:

1. Press FIN CFLO . You will see either FLOW(@)=? if the current list is empty, or FLOW(1 or more)=? if the list is not empty. This is the bottom of the current list.

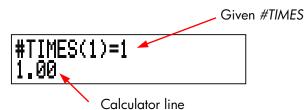

- 2. If the list is *not* empty, you can do either **a** or **b**:
 - **a.** Clear the list by pressing CLR DATA YES (see also page 99.)
 - b. Get a new list by pressing GET *NEW (The old list must be named first. Press NAME or see page 97.)
- 3. If the cash flows are *ungrouped* (that is, they are all different), then press #T? to turn #TIMES PROMPTING OFF. For grouped cash flows, leave this prompting on. (For more information, see "Prompting for #TIMES," next page.)
- 4. Key in the value of the initial cash flow, FLOW(0) (remember that money paid out is negative use +/- to change the sign), and press INPUT.*
- **5.** After briefly showing FLOW(0), the display shows FLOW(1)=?. (To view FLOW(0) longer, hold down INPUT before releasing it.) Key in the value for FLOW(1) and press INPUT. The prompt for the next item appears.
- **6. For grouped cash flows:** The display now shows #TIMES(1)=1. If it does not, press EXIT #T? to turn the #TIMES prompting on. (See "Prompting for #TIMES," below.) #TIMES is the number of consecutive occurrences of FLOW(1). #TIMES has

^{*} You can do calculations with a number before entering it. This does not interfere with the list. When you press INPUT, the evaluated expression or number is entered into the list.

been automatically set to 1, and 1.00 is displayed on the calculator line. Do either **a** or **b**:

- To retain the value 1 and go on to the next flow, press INPUT (or ▼).
- **b.** To change #TIMES, key in the number and press [INPUT].*

- **7.** Continue entering each cash flow and, for grouped flows, the number of times it occurs. The calculator recognizes the end of the list when a flow is left blank (no value is entered).
- **8.** Press EXIT to end the list and restore the CFLO menu. You can now proceed to correct the list, name the list, get another list, or do calculations with the values.

Use these same instructions to enter additional lists.

Prompting for #TIMES (#T?). When the calculator displays

#TIMES(1)=1, it is *prompting* you for the number of times the current flow occurs. If *all* your cash flows are different (*#TIMES* always 1), then you don't need the #TIMES prompt. You can turn the prompting for *#TIMES* on and off by pressing #T? in the CFLO menu. This produces a brief message: either #TIMES

PROMPTING: OFF, or #TIMES PROMPTING: ON.

While prompting is off, all cash flows you enter will have #TIMES = 1.

When you are viewing a cash-flow list with the #TIMES prompting off, the calculator displays only those #TIMES values that are not 1.

96 7: Cash Flow Calculations

^{*} The maximum #TIMES for each cash flow is 999.

The #TIMES prompting is usually on, because it is automatically turned on whenever you clear or get a cash-flow list.

Example: Entering Cash Flows. Enter the following ungrouped cash flows in a list and find the percentage internal rate of return (IRR).

0: \$-500 2: \$275 1: 125 3: 200

Keys:	Display:	Description:
FIN CFLO		
CLR DATA	CLEAR THE LIST?	Asks for confirmation.
YES	FLOW(0)=?	Clears data from list and
		prompts for initial flow.
#T?	#TIMES PROMPTING:	Sets prompting off be-
	OFF	cause it is not needed.
500 +/- INPUT	FLOW(1)=?	Enters initial flow; then
	-500.00	immediately prompts for
		next flow.
125 INPUT	FLOW(2)=?	Enters FLOW(1); prompts
	125.00	for next flow.
275 [INPUT]	FLOW(3)=?	Enters FLOW(2); prompts
	275.00	for next flow.
200 INPUT	FLOW(4)=?	Enters FLOW(3); prompts
	200.00	for next flow.
EXIT CALC	NPV, NUS, NFV NEED	Ends list and displays
	1%	CALC menu.
IRR%	IRR%=9.06	Calculates IRR.

Viewing and Correcting the List

To display a particular list, use GET (see page 99).

The ▲ and ▼ keys move up and down one number at a time.

■ ▲ and ■ ▼ display the beginning and end of the list.

Changing or Clearing a Number. To change a number after it's been entered: display the number, key in the new value, and press INPUT.

Use this same method to clear a number to zero. (Do not press CLR or , which clear the calculator line, not the cash-flow entry.)

Inserting Cash Flows into a List. Insertion occurs before (above) the current flow. Pressing INSR inserts a zero cash flow and renumbers the rest of the list. You can then enter a new cash flow and its #TIMES.

For example, if FLOW(6) is in the display, pressing INSR puts a new, zero flow between the previously numbered FLOW(5) and FLOW(6).

Deleting Cash Flows from a List. Pressing **DELET** deletes both the current flow and its #TIMES.

Copying a Number from a List to the Calculator Line

To copy a number from the list into the calculator line, use \blacktriangledown or \blacktriangle to display the number, then press \blacksquare CL \blacksquare NPUT.

Naming and Renaming a Cash-Flow List

A new list has no name. You may name it before or after filling the list, but you *must* name it in order to store another list.

To name a list:

- 1. Press NAME from the CFLO menu.
- 2. Use the ALPHA menu to type a name. (The ALPHA and ALPHA-Edit menus are covered on pages 30 32.) To clear a name, press CLR.
- 3. Press INPUT.

98 7: Cash Flow Calculations

The name can be up to 22 characters long and include any character except: $+ - x \div () <> := space *$

But only the first three to five characters (depending on letter widths) of the name are used for a menu label. Avoid names with the same first characters, since their menu labels will look alike.

Viewing the Name of the Current List. Press NAME, then EXIT.

Starting or GETting Another List

When you press CFLO, the cash-flow list that appears is the same as the last one used.

To start a new list or switch to a different one, the current list must be named or cleared. If it is named, then:

- 1. Press GET .The GET menu contains a menu label for each named list plus *NEW .
- 2. Press the key for the desired list. (*NEW brings up a new, empty list.)

Clearing a Cash-Flow List and Its Name

To clear a list's numbers and name:

- **1.** Display the list you want to clear, then press CLR DATA YES . This removes the numbers.
- 2. If the list is named, you'll see ALSO CLEAR LIST NAME? Press YES to remove the name. Press NO to retain the name with an empty list.

^{*} CFLO does accept these exceptional characters in list names, but the Solver functions SIZEC, FLOW, and #T do not.

To remove just one value at a time from a list, use DELET.

Cash-Flow Calculations: IRR, NPV, NUS, NFV

Once you have entered a list of cash flows, you can calculate the following values in the CALC menu.

- Sum (TOTAL).
- Internal rate of return (IRR%). This is a periodic rate of return. To calculate an annual nominal rate when the period is not a year, multiply the IRR% by the number of periods per year.
 If you want the IRR% as an effective annual rate, then use the FIN ICNV menu to convert from the nominal annual rate to the effective annual rate.
- Net present value (NPV), net uniform series (NUS), and net future value (NFV) for a specified, periodic interest rate, 1%.

Table 7-2. The CALC Menu for CFLO Lists

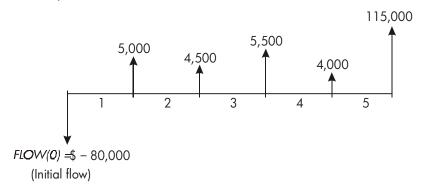

Menu Label	Description
TOTAL	Calculates the sum of the cash flows.
IRR% *	Calculates the <i>internal rate of return</i> —the interest (discount) rate at which the net present value of the cash flows equals zero.
I%	Stores the <i>periodic interest rate</i> , expressed as a percentage (sometimes called <i>cost of capital</i> , <i>discount rate</i> , or <i>required rate of return</i>).
NPV	Given 1%, calculates the net present value—the present value of a series of cash flows.
NUS	Given 1%, calculates the <i>net uniform series</i> —the dollar amount of constant, equal cash flows having a present value equivalent to the net present value.
NFV	Given 1%, calculates the <i>net future value</i> of a series of cash flows by finding the future value of the net present value.

^{*} The calculations for internal rate of return are complex and may take a relatively long time. To interrupt the calculation, press any key. In certain cases, the calculator displays a message indicating that the calculation cannot continue without further information from you, or that there is no solution. Refer to appendix B for additional information about calculating IRR%.

About the Internal Rate of Return (IRR%). A "conventional investment" is considered attractive if IRR% exceeds the cost of capital. A conventional investment meets two criteria—(1) the sequence of cash flows changes sign only once, and (2) the sum (TOTAL) of the cash flows is positive.

Remember that the calculator determines a periodic IRR%. If the cash flows occur monthly, then IRR% is a monthly value, too. Multiply it by 12 for an annual value.

Example: Calculating IRR and NPV of an Investment. An investor makes an initial investment of \$80,000, and expects returns over the next five years as illustrated below.

Calculate the total of the cash flows and the internal rate of return of the investment. In addition, calculate the net present value and net future value, assuming an annual interest rate of 10.5%.

Start the problem with an empty cash-flow list. Since the cash flows are ungrouped, each one occurs just once. Turn off the #TIMES prompt to make cash-flow entry faster.

Keys:		Display:	Description:
FIN			Displays current cash-flow
CFLO			list and CFLO menu keys.
CLR DA	ATA		Clears current list or gets a
YES			new one. The empty list
or			prompts for its initial cash
GET	*NEM	FLOW(0)=?	flow.
#T?		#TIMES PROMPTING:	Briefly shows the status of
		OFF	#T? then returns to the
			list. With prompting off,
			all cash flows are

102 7: Cash Flow Calculations

		assumed to occur just
		once.
80000 +/-	FLOW(1)=?	Prompts for next cash
INPUT	-80,000.00	flow. Calculator line
		shows last number
		entered.
5000 INPUT	FLOW(2)=?	Stores \$5,000 for
		FLOW(1), prompts for
		next flow.
4500 INPUT	FLOW(3)=?	Stores FLOW(2).
5500 INPUT	FLOW(4)=?	Stores FLOW(3).
4000 INPUT	FLOW(5)=?	Stores FLOW(4).
115000 INPUT	FLOW(6)=?	Stores final cash flow and
		shows end of list.
EXIT CALC		Calculates sum of the cash
TOTAL	TOTAL=54,000.00	flows.
IRR%	IRR%=11.93	Calculates internal rate of
		return.
10.5 I%	I%=10.50	Stores periodic interest
		rate.
NPV	NPV=4,774,63	Calculates NPV.
NFV	NFV=7,865,95	Calculates NFV.

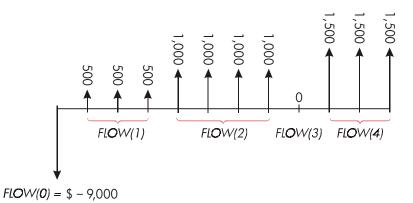

Now calculate the net present value at an interest rate of 10.5% if cash flow #4 is reduced to \$1,000.

EXIT	FLOW(6)=?	Displays the bottom of the
		list.
	FLOW(4)=4,000.00	Moves to cash flow #4.
1000 INPUT	FLOW(5)=115,000.0	[©] Changes cash flow #4 to
		\$1.000.

EXIT CALC NPV=2,762,43 Calculates new NPV.

NPV

Example: An Investment with Grouped Cash Flows. You are considering an investment that requires a cash outlay of \$9,000, with the promise of monthly cash flows as shown. Calculate *IRR%*. Also find *NPV* and *NFV* at an annual interest rate of 9%.

Since some of these cash flows are *grouped* (consecutive and equal), the *#TIMES* prompting must be on so you can specify a number other than 1.

Group Number	Amount	Number of Times
Initial	-9,000	_
1	500	3
2	1,000	4
3	0	1
4	1,500	3

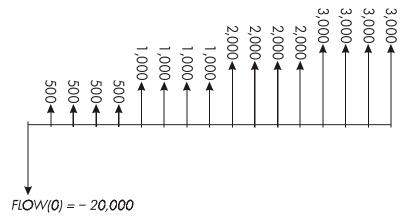

104 7: Cash Flow Calculations

	YES	FLOW(0)=?	prompting is turned on.
	9000 +/- INPUT	FLOW(1)=?	Stores the initial cash
			flow.
	500 INPUT	#TIMES(1)=1	Stores FLOW(1) and
			prompts for #TIMES(1).
	3 INPUT	FLOW(2)=?	FLOW(1) occurs 3 times;
			prompts for next cash
			flow.
	1000 INPUT 4		Stores FLOW(2) four
	INPUT	FLOW(3)=?	times.
	0 INPUT		Stores FLOW(3) one time
	INPUT	FLOW(4)=?	(the 1 is automatically
			entered).
	1500 INPUT 3		Stores FLOW(4) three
	INPUT	FLOW(5)=?	times.
	EXIT CALC		Displays the CALC menu.
	IRR%	IRR%=1.53	Calculates monthly IRR%.
/	9 ÷ 12		Stores the periodic,
•	1%	I%=0.75	monthly interest rate.
	NPV	NPV=492.95	Calculates NPV.
	NFV	NFV=535.18	Calculates NFV.

Example: An Investment with Quarterly Cash Returns. You have been offered an opportunity to invest \$20,000. The investment returns quarterly payments over four years as follows:

Year 1	4 payments of \$500
Year 2	4 payments of \$1,000
Year 3	4 payments of \$2,000
Year 4	4 payments of \$3,000

Calculate the annual rate of return for this investment. (The prompting for #TIMES should be on.)

106 7: Cash Flow Calculations

FLOW(5)=? **INPUT** Calculates quarterly rate EXIT IRR%=2.43 of return. IRR% 9.72 × 4 = Calculates nominal annual rate of return from quarterly rate.

Doing Other Calculations with CFLO Data

If you would like to do other calculations with cash flows besides those in the CALC menu, you can do so by writing your own Solver equations. There are Solver functions that can access data stored in CFLO lists, and there is a summation function that can combine all or part of the values stored in specific lists.

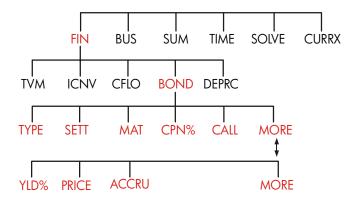

Refer to "Accessing CFLO and SUM Lists from the Solver" in chapter 12.

Bonds

The BOND menu calculates the *yield to maturity* or *price* of a bond. It also calculates *yield to call* on a coupon date and *accrued interest*. You can specify the:

- Calendar basis: 30/360 or actual/actual (days per month/days per year). Municipal, state, and corporate bonds issued in the United States are typically 30/360. U.S. Treasury bonds are actual/actual.
- Coupon payments: semi-annual or annual. Most U.S. bonds are semi-annual.

The BOND Menu

Pressing BOND shows you the BOND menu and the type of bond currently specified: 30/360 or A/A; SEMIANNUAL or ANNUAL.

Table 8-1. BOND Menu Labels

Menu Label	Description	
TYPE	Displays a menu of bond types: 30/360 or actual/actual, semi-annual or annual.	
SETT	Stores the settlement (purchase) date according to the current date format (MM.DDYYYY or DD.MMYYYY; see page 143).	
MAT	Stores the maturity date <i>or</i> call date according to the current date format. The call date must coincide with a coupon date.	
CPN%	Stores the annual coupon rate as a percentage.	
CALL	Stores the call price per \$100 face value. For a yield to <i>maturity</i> , make sure <i>CALL</i> equals 100. (A bond at maturity has a "call" value that is 100% of its face value.)	
	MORE	
YLD%	Stores or calculates the yield (as an annual percentage) to maturity <i>or</i> yield to call date.	
PRICE	Stores or calculates the price per \$100 face value.	
ACCRU	Calculates the interest accrued from the last coupon-payment date until the settlement date, per \$100 face value.	

The calculator retains the values of the BOND variables until you clear them by pressing CLR DATA while the BOND menu is displayed. Clearing sets *CALL* to 100 and all other variables to zero.

To see the value currently stored in a variable, press (RCL) menu label.

Doing Bond Calculations

Remember that values in the BOND menu are expressed per \$100 face value or as a percentage. A CALL value of 102 means that the bond will be worth \$102 for every \$100 of face value when called. Some corporate bonds in the United States use the convention that the price of the bond is set to 100 if the coupon rate equals the yield, whether or not the settlement date is a coupon date. The BOND menu does *not* use this convention.

To calculate the price or yield of a bond:

- 1. Display the BOND menu: press FIN BOND.
- 2. Press CLR DATA. This sets CALL=100.
- **3.** Define the type of bond. If the message in the display does not match the type you want, press TYPE.

- Pressing 360 sets the calendar basis to a 30-day month and a 360-day year.
- Pressing R/A sets the calendar basis to the actual calendar month and to the actual calendar year.
- Pressing SEMI sets semi-annual coupon payments.
- Pressing FINN sets annual coupon payments.

Press EXIT to restore the BOND menu.

- **4.** Key in the settlement date (MM.DDYYYY or DD.MMYYYY depending on the date format; see chapter 11) and press SETT.
- **5.** Key in the maturity date *or* call date and press MAT
- **6.** Key in the coupon rate as an annual percent and press CPN:
- 7. Key in the call value, if any, and press CALL . For a bond held to

110 8: Bonds

maturity, the CALL value must equal 100. (See step 3.)

- **8.** To calculate a result, first press MORE to access the remaining menulabels. Do either **a** or **b**:
 - **a.** Key in the yield and press YLD%. Press PRICE to calculate the price.
 - **b.** Key in the price and press PRICE. Press YLD% to calculate the yield.

To calculate the accrued interest, press ACCRU. The *total* amount owed \checkmark the seller is PRICE + ACCRU, that is: PRICE + ACCRU =.

Calculating Fractional Values. When given a fractional value that must be entered in decimal form, do the arithmetic and then store the result directly into a variable. Do not clear the arithmetic and then retype the result before storing it—this is an unnecessary step that can cause incorrect answers due to rounding. See how the following example stores $8^3/_8$ in YLD%.

Example: Price and Yield of a Bond. What price should you pay on August 10, 2003 for a $6\frac{3}{4}\%$ U.S. Treasury bond that matures on May 1, 2018 if you wish a yield of $8\frac{3}{8}\%$? The calendar basis is actual/actual and the coupon payments are semi-annual. (The example assumes MM.DDYYYY date format.)

Keys:	Display:	Description:
FIN BOND		Since there is no call on
CLR DATA		this bond, set <i>CALL</i> = 100 by clearing variables.
TYPE R/R		Sets bond type, if
SEMI EXIT	A/A SEMIANNUAL	necessary.
8.102003		Stores settlement
SETT	SETT=	(purchase) date.
	08/10/2003 SUN	
5.012018		Stores maturity date.

8: Bonds 111

MAT	MAT=05/01/2018 TUE	
6.75 CPN%	CPN%=6.75	Stores annual coupon rate.
MORE		Stores desired yield
√ 3 ÷ 8 + 8		(displayed rounded to two
YLD%	YLD%=8.38	decimal places).*
PRICE	PRICE=86.38	Result: price is \$86.38 per \$100 face value.
✓ ⊕ ACCRU	86.38+1.85	Adds accrued interest owed the seller.
√ ≡	88.23	Net price.

Suppose that the market quote for the bond is 88%. What yield does it represent?

88.25 PRICE	PRICE=88.25	Stores quoted price.
YLD%	YLD%=8.13	Result: yield to maturity.

Example: A Bond with a Call Feature. What is the price of a 6% corporate bond maturing on March 3, 2022 and purchased on May 2, 2003 to yield 5.7%? It is callable on March 3, 2006 (a coupon date), at a value of 102.75. What is the yield to the call date? Use a 30/360 calendar with semi-annual coupon payments.

Keys:	Display:	Description:
FIN BOND		Displays BOND menu,
CLR DATA		clears variables.
TYPE 360		Sets bond type, if
SEMI EXIT	30/360 SEMIANNUAL	necessary.

^{*} To see the full precision of the number, press SHOW.

112 8: Bonds

5.0220	03 SETT	SETT=	Stores purchase date
		05/02/2003 FRI	(MM.DDYYYY format).
3.0320	22 MAT	MAT=03/03/2022 THU	Stores maturity date.
6 CPN%	:	CPN%=6.00	Stores annual coupon
			rate.

Depreciation

The DEPRC (depreciation) menu calculates depreciation values and remaining depreciable values one year at a time. The methods available are:

- Declining balance.
- Sum-of-the-years' digits.
- Straight line.
- Accelerated Cost Recovery System.

The DEPRC Menu

Pressing DEPRC displays the DEPRC menu.

114 9: Depreciation

Table 9-1. DEPRC Menu Labels

Menu Label	Description
BRSIS	Stores the depreciable cost basis of the asset at acquisition.
SALV	Stores the salvage value of the asset at the end of its useful life. If there is no salvage value, set SALV=0.
LIFE	Stores the expected useful life (in whole years) of the asset.
ACRS%	Stores the appropriate Accelerated Cost Recovery System percentage from the published ACRS tables.
ACRS	Calculates the ACRS deduction based on <i>BASIS</i> and <i>ACRS%</i> . (The values in <i>SALV</i> , <i>LIFE</i> , <i>FACT%</i> , and <i>YR#</i> do not matter.)
	MORE
YR#	Stores the number of the year for which you want the depreciation (1, 2, etc.).
FACT%	Stores the declining-balance factor as a percentage of the straight-line rate. This is for the DB method only. For example, for a rate 1¼ times (125%) the straight-line rate, enter 125.
DB	Calculates the declining-balance depreciation for the year.
SOYD	Calculates the sum-of-the-years'-digits depreciation for the year.
SL	Calculates the straight-line depreciation for the year.
•	Displays the remaining depreciable value, <i>RDV</i> , after you have pressed DB , SOYD , or SL .

The calculator retains the values of the DEPRC variables until you clear them by pressing CLRDATA while the DEPRC menu is displayed.

To see the value currently stored in a variable, press (RCL) menu label.

Doing Depreciation Calculations

DB, SOYD, and SL Methods

To calculo	ite the	depreciation	for an	asset:*
------------	---------	--------------	--------	---------

- 1. Display the DEPRC menu: press FIN DEPRC.
- **2.** Define the characteristics of the asset:
 - **a.** Key in the cost basis and press BASIS
 - **b.** Key in the salvage value and press SALV. If there is no salvage value, enter zero.
 - c. Key in the useful life and press LIFE .
- 3. Press MORE for the rest of the DEPRC menu.
- **4.** Key in the number for the year of depreciation you want to calculate (1, 2, 3, etc.) and press YR# .
- 5. If you are using the declining-balance method, enter the DB factor (a percentage) and press FACT*.
- **6.** Press DB , SOYD , or SL to calculate the appropriate depreciation.
- To see the remaining depreciable value (basis salvage value accumulated depreciation), press ▼.
- **8.** To calculate the depreciation for another year, just change YR# and press DB , SOYD , or SL again.

116 9: Depreciation

^{*} The calculated values of *RDV*, *DB*, *SOYD*, and SL are rounded internally to the number of decimal places specified by the current display setting. A setting of FIX 2 means that these values will be rounded internally to two decimal places.

Example: Declining-Balance Depreciation. A metalworking machine, purchased for \$10,000, is to be depreciated over 5 years. Its salvage value is estimated at \$500. Find the depreciation and remaining depreciable value for each of the first 3 years of the machine's life using the double-declining-balance method (200% of the straight-line rate). For comparison, find the straight-line depreciation, as well.

Keys:	Display:	Description:
FIN DEPRC 10000 BASIS	BASIS=10,000.00	Displays DEPRC menu. Cost basis.
500 SALV	SALV=500.00	Salvage value.
5 LIFE	LIFE=5.00	Useful life.
MORE] YR#	YR#=1.00	First year of depreciation.
200 FACT%	FACT%=200.00	DB percentage factor.
DB	DB=4,000.00	Depreciation in first year. (Salvage value ignored at this point.)
▼	RDV=5,500.00	Remaining depreciable value after first year (BASIS - SALV - 4,000).
2 YR# DB	DB=2,400.00	Depreciation in second year.
▼	RDV=3,100.00	Remaining depreciable value after second year.
3 YR# DB	DB=1,440.00	Depreciation in third year.
•	RDV=1,660.00	Remaining depreciable value after third year.
SL	SL=1,900.00	Straight-line depreciation for each year.

▼ RDV=3,800.00

Remaining depreciable value after third year using SL.

The ACRS Method

To calculate the amount of tax deduction under the U.S. Accelerated Cost Recovery System:

- 1. Display the DEPRC menu: press FIN DEPRC
- 2. Enter the cost basis of the asset and press BASIS
- 3. The Internal Revenue Service publishes tables that list the percentage of an asset's basis that can be deducted each year of its prescribed life. Look up that value, enter it, and press ACRS*.
- **4.** Press ACRS to calculate the value of the deduction.

Example: ACRS Deductions. Use the ACRS method to find the income-tax deduction for a \$25,000 asset over 3 years of a 5-year life. Use this hypothetical ACRS table:

Percentage Deductible
15
25
20
20
20

Keys:	Display:	Description:
FIN DEPRC		DEPRC menu.
25000 BASIS	BASIS=25,000.00	Enters basis.
15 ACRS%	ACRS%=15.00	Tabular value, year 1.
ACRS	ACRS=3,750.00	Deduction in first year.

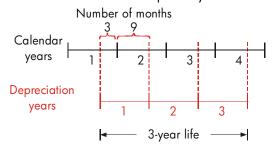

118 9: Depreciation

25 ACRS%	ACRS%=25.00	Tabular value, year 2.
ACRS	ACRS=6,250.00	Deduction in second year.
20 ACRS%	ACRS%=20.00	Tabular value, year 3.
ACRS	ACRS=5,000.00	Deduction in third year.

Partial-Year Depreciation

When the acquisition date of an asset does not coincide with the start of the tax or fiscal year, then the amounts of depreciation in the first and last years are computed as fractions of a full year's depreciation. Except in SL, the intermediate years are computed as sums of fractions. This does not apply to the ACRS method.

Suppose you acquired an asset in October and wanted to depreciate it for 3 years. (Your fiscal year begins January 1st.) The depreciation schedule would affect parts of 4 years, as shown in the illustration. The 3 months from October to December equal 1/4 year.

For SL depreciation, partial-year calculations are easy: calculate the SL value, then use $\frac{1}{4}$ of that value for the first year, the full amount the second and third years, and 3/4 of that amount the fourth year.

For DB and SOYD depreciation, each year's depreciation value is different, as shown in the table:

Calendar Year	Depreciation Value
1 (OctDec.)	1/4 x year 1
2	(¾ x year 1) + (¼ x year 2)
3	(¾ x year 2) + (¼ x year 3)
4 (JanSept.)	¾ x year 3

Example: Partial-Year Depreciation. A movie camera bought for \$12,000 has a useful life of 10 years with a salvage value of \$500. Using the sum-of-the-years'-digits method, find the amount of depreciation for the fourth year. Assume the first depreciation year was 11 months long.

Keys:	Display:	Description:

+ RCL 1 =	1,481.06	Figures total depreciation
v ====================================		for year 4.
		,

120 9: Depreciation

Running Total and Statistics

The SUM menu stores and statistically analyzes sets of numbers. As you enter the numbers, the calculator displays their running total. Once you've entered the numbers into a *list*, you can:

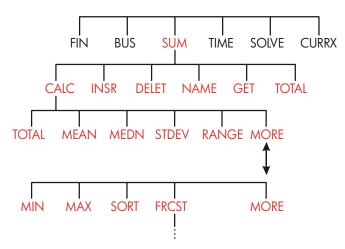

- Calculate the mean, median, standard deviation, and range.
- Display the largest and smallest number in the list.
- Sort the list from smallest number to largest number.

With two lists of numbers, you can:

- Do curve-fitting and forecasting calculations using two SUM lists and one of four models—linear, exponential, logarithmic, and power. (Curve fitting for the linear model is called *linear regression*.)
- Calculate the weighted mean and grouped standard deviation.
- Find the summation statistics ($\sum x$, $\sum x^2$, $\sum y$, $\sum y^2$, $\sum xy$).

You can store many separate lists of numbers in SUM. The maximum number depends on the amount of available calculator memory.

The SUM Menu

The SUM menu creates lists of numbers and performs calculations with a SUM list.

Table 10-1. SUM Menu Labels

Menu Label	Description
CALC	Accesses the CALC menu to calculate the total, mean, median, standard deviation, range, minimum, maximum, sorting, and linear regression (including weighted mean and summation statistics).
INSR	Allows you to insert numbers into the list.
DELET	Deletes numbers from the list.
NAME	Allows you to name the list.
GET	Allows you to switch from one named list to another or to create a new list.
TOTAL	Displays the total of all the items in the list.

122 10: Running Total and Statistics

To see the calculator line when this menu is in the display, press <a>INPUT once. (This does not affect number entry.)

To see this menu when the calculator line is in the display, press EXIT.

Creating a SUM List

To keep a running total of a list of numbers or do statistical calculations with sets of data, first create a SUM list of the values.

Entering Numbers and Viewing the TOTAL

To enter numbers into a SUM list:

 Press SUM . You'll see ITEM(1)=? if the current list is empty, or ITEM(2 or more)=? if the list is not empty. This is the bottom of the current list.

- 2. If the list is empty, start filling it (step 3). If the current list is *not* empty, you can do either **a** or **b**:
 - Clear the list by pressing
 ☐ CLR DATA YES (see also page 127.)
 - **b.** Get a new list by pressing GET *NEW (The old list must be named first. Press NPME or see page 126.)
- **3.** Key in the value of the first item, *ITEM(1)* (press +/- for a negative number), and press INPUT.* (To view *ITEM(1)* longer, hold down INPUT before releasing it.)

^{*} Remember that you can do calculations with a number before entering it. This does not interfere with the list. Whenever you press INPUT, the number (or evaluated expression) in the calculator line is entered into the list. If you need to use the MATH menu, just press MATH, do the calculation, then press EXIT) to return to where you were in SUM.

After briefly showing ITEM(1), the display shows

ITEM(2)=?

TOTAL=number

TOTAL is the updated, running TOTAL of all the numbers in the list (only one number, so far).

- **4.** To enter *ITEM(2)*, key in the value and press <u>INPUT</u>. The prompt for *ITEM(3)* and the new, updated total appear.
- Continue entering values for ITEM(3), ITEM(4), etc. The calculator recognizes the end of the list when an item is left blank (no value is entered).
- 6. Press EXIT to end the list and restore the SUM menu. You can now proceed to correct the list, name the list, get another list, or do statistical calculations.

Use these same instructions to enter additional lists.

Viewing and Correcting the List

To display a particular list, use GET (see page 127).

Changing or Clearing a Number. To change a number after it's been entered: display the number, key in the new value, and press INPUT.

Use the same method to clear a number to zero. (Do not press CLR or , which clears the calculator line.)

Inserting Numbers into a List. Insertion occurs before (or above) the current entry. Pressing INSR inserts a zero item and renumbers the rest of the list. You can then enter a new value.

For example, if *ITEM*(6) is in the display, pressing INSR puts a new, zero item between the previously numbered *ITEM*(5) and *ITEM*(6).

124 10: Running Total and Statistics

Deleting Numbers from a List. Pressing **DELET** deletes the current item.

Example: Updating a Checkbook. On May 31, your checking account balance was \$267.82. The transactions for the first 10 days in June are:

Date	Transaction	Amount	Date	Transaction	Amount
6/1	Balance	267.82	6/3	Check	-128.90
6/1	Deposit	837.42	6/7	Check	-65.35
6/1	Check	-368.23	6/10	Deposit	55.67
6/2	Check	-45.36			

Update the checkbook by calculating the running balance.

Keys:	Display:	Description:
SUM *		
CLR DATA YES	ITEM(1)=?	Displays empty SUM list.
267.82 INPUT	ITEM(2)=?	Enters beginning balance
	TOTAL=267.82	and shows running total.
837.42 INPUT	ITEM(3)=?	Enters deposit on 6/1.
	TOTAL=1,105,24	
368.23 +/-		Enters remaining
INPUT		transactions.
45.36 +/-		
INPUT		
128.90 +/-		
INPUT		
65.35 +/-		
INPUT		

^{*} If you want to preserve the current list, skip the next step (pressing — CLEDATA). Instead, name the list and then press GET *NEW .

55.67 INPUT ITEM(8)=?

TOTAL=553.07

EXIT ITEM(8)=?

Ends list and displays SUM menu again.

Copying a Number from a List to the Calculator Line

To copy a number from the list into the calculator line, use \blacktriangledown or \blacktriangle to display the number, then press \blacksquare CL \blacksquare NPUT.

Naming and Renaming a SUM List

A new list has no name. You may name it before or after filling the list, but you *must* name it in order to store another list.

To name a list:

- 1. Press NAME from the SUM menu.
- 2. Use the ALPHA menu to type in a name. (The ALPHA and ALPHA-Edit menus are covered on pages 30 32.) To clear a name, press CLR.
- **3.** Press INPUT.

The name can be up to 22 characters long and include any character except: $+ - x \div () <> := space *$

But only the first three to five characters (depending on letter widths) of the name are used for a menu label. Avoid names with the same first characters, since their menu labels will look alike.

Viewing the Name of the Current List. Press NAME , then EXIT.

126 10: Running Total and Statistics

^{*} SUM does accept these exceptional characters in list names, but the Solver functions SIZES and ITEM do not.

Starting or GETting Another List

When you press SUM, the SUM list that appears is the last one used.

To start a new list or switch to a different one, the current list must be named or cleared. If it is named, then:

- 1. Press GET . The GET menu contains a menu label for each named list plus *NEW .
- 2. Press the key for the desired list. (*NEW brings up a new, empty list.)

Clearing a SUM List and Its Name

To clear a list's numbers and name:

- **1.** Display the list you want to clear, then press CLR DATA YES. This removes the numbers.
- 2. If the list is named, you'll see ALSO CLEAR LIST NAME? Press

 YES to remove the name. Press NO to retain the name with an empty list.

To remove just one value at a time from a list, use DELET.

Doing Statistical Calculations (CALC)

Once you have entered a list of numbers, you can calculate the following values.

- For one variable: the total, mean, median, standard deviation, range, minimum, and maximum. You can also sort the numbers in order of increasing value.
- For two variables: x-estimates and y-estimates (this is also called forecasting), the correlation coefficient for different types of curves (this is curve-fitting), the slope and y-intercept of the line, and summation statistics. You can also find the weighted mean and the grouped standard deviation.

Calculations with One Variable

The CALC menu calculates the following statistical values using one SUM list.

Table 10-2. The CALC Menu for SUM Lists

Menu Key	Description	
TOTAL	Calculates the sum of the numbers in the list.	
MEAN	Calculates the arithmetic mean (average).	
MEDN	Calculates the median.	
STDEV	Calculates the standard deviation.*	
RANG	Calculates the difference between the largest and smallest number.	
	MORE	
MIN	Finds the smallest (minimum) number in the list.	
MAX	Finds the largest (maximum) number in the list.	
SORT	Sorts the list in ascending order.	
FRCST	Displays a series of menus for calculations with two variables for curve fitting, estimation, weighted mean and grouped standard deviation, and summation statistics.	

^{*} The calculator finds the *sample* standard deviation. The formula assumes that the list of numbers is a sampling of a larger, complete set of data. If the list is, in fact, the entire set of data, the *true population standard deviation* can be computed by calculating the mean of the original list, placing that value into the list, and then calculating the standard deviation.

Example: Mean, Median, and Standard Deviation. Suppose your shop had the following phone bills during the past six months:

Month	Phone Expense	Month	Phone Expense
1. May	\$340	4. August	\$780
2. June	\$175	5.September	\$245
3. July	\$450	6. October	\$625

Calculate the mean, median, and standard deviation of the monthly phone bills. Then display the smallest value in the list.

Keys:	Display:	Description:
SUM		Displays current SUM list and SUM menu keys.
CLR DATA		Clears current list or gets a
YES		new one.
or		
GET *NEW	ITEM(1)=?	
340 INPUT	ITEM(2)=?	Stores May's phone bill;
	TOTAL=340.00	shows total.
175 [INPUT]	ITEM(3)=?	Stores June; updates total.
	TOTAL=515.00	
450 [INPUT]		Stores phone bills for
780 [INPUT]		July-October and keeps a
245 INPUT		running total.
625 INPUT	ITEM(7)=?	
	TOTAL=2,615.00	
EXIT CALC	2,615.00	Displays CALC menu.
MERN	MEAN=435.83	Calculates mean.
MEDN	MEDIAN=395.00	Calculates median.
STDEV	STDEV=231.55	Calculates standard

deviation.

Displays rest of CALC

menu.

MIN=175.00 Finds smallest number.

Calculations with Two Variables (FRCST)

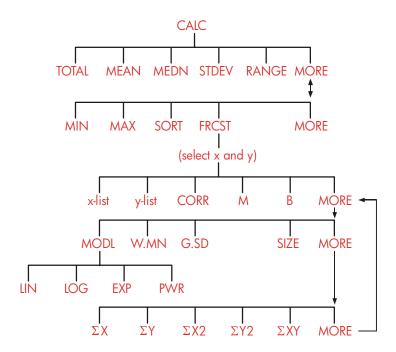

The FRCST menu does the following two-variable calculations using two SUM lists:

- Fits x- and y-data to a linear, logarithmic, exponential, or power curve.
- Forecasts estimated values based on that curve.

MORE

MIN

- Finds the weighted mean and grouped standard deviation.
- Shows you the summation statistics (Σx , Σx^2 , Σy , Σy^2 , Σxy , etc.).

After pressing FRCST, you must specify two previously created lists—one for the x-variable and one for the y-variable. The two lists must have the same number of items.

Table 10-3. FRCST Menu Labels

Menu Label	Description
list name for x-variable list name for y-variable	These specify the two lists of data to be compared. Also used for estimations:store x and estimate y, or vice-versa. *CURR is the menu label for an unnamed current list.
CORR *	Calculates the correlation coefficient, a number between -1 and $+1$ that measures how closely the x,y data points match the calculated curve.
M *	Calculates M. For the linear model, this is the slope.
B *	Calculates B. For the linear model, this is the <i>y</i> -intercept.
	MORE MORE
MODL	Displays a choice of the four curve-fitting models: LIN , LOG , EXP , and PWR .
W.MN	Calculates the weighted mean of the x-values using the weights in the y-list.
G.SD	Calculates the standard deviation of a set of x-values grouped by frequencies specified in the y-list.
SIZE	The number of items in either list.
	MORE
ΣX	Sum of items in x-list.
ΣΥ	Sum of items in <i>y</i> -list.
ΣΧ2	Sum of squares of items in x-list.
ΣΥ2	Sum of squares of items in y-list.
ΣΧΥ	Sum of products of items in x- and y-lists.
* For the non-linear models,	the calculation uses the <i>transformed</i> data values.

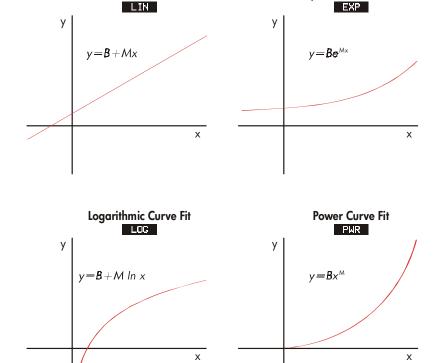

132 10: Running Total and Statistics

Curve Fitting and Forecasting

Linear Curve Fit

Curve fitting is a statistical method for finding a relationship between two variables, x and y. Based on this relationship, you can *estimate* new values of y based on a given x-value, and vice-versa. Each SUM list holds the numbers (data values) for one variable. You can select one of four curve-fitting *models*:*

Exponential Curve Fit

^{*} The exponential, logarithmic, and power models are calculated using transformations that allow the data to be fitted by standard linear regression. The equations for these transformations appear in appendix B. The logarithmic model requires positive x-values; the exponential model requires positive y-values; and the power curve requires positive x- and y-values.

To do curve fitting and forecasting:

- Enter the data into two SUM lists: one for the x-values and one for the y-values. Make sure each list has the same number of items so that the items are in matched pairs.
- 2. From the SUM menu, press CALC MORE FRCST to display a menu of SUM-list names. The current list is labeled *CURR unless named otherwise.
- **3.** Press a menu key to select a list of x-values (independent variable).
- **4.** Select a list of y-values (dependent variable).
- 5. Now you see the FRCST menu. Whichever curve-fitting model was used last is named in the display. If you want to select a different model, press MORE MODL, and then the menu key for the model.

6. To calculate the curve-fitting results, press, CORR , M and B .

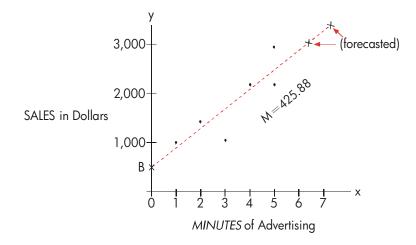

7. To forecast (estimate) a value:

- **a.** Key in the known value and press the menu key for that variable.
- b. Press the menu key for the variable whose value you want to forecast.

Example: Curve Fitting. BJ's Dahlia Garden advertises on a local radio station. For the past six weeks, the manager has kept records of the number of minutes of advertising that were purchased, and the sales for that week.

	Number of Minutes of Radio Advertising (x-values, <i>MINUTES</i>)	Dollar Sales (y-values, <i>SALES</i>)
Week 1	2	\$1,400
Week 2	1	\$ 920
Week 3	3	\$1,100
Week 4	5	\$2,265
Week 5	5	\$2,890
Week 6	4	\$2,200

BJ's wants to determine whether there is a linear relationship between the amount of radio advertising and the weekly sales. If a strong relationship exists, BJ's wants to use the relationship to forecast sales. A graph of the data looks like this:

Keys:	Display:	Description:
SUM		Displays current SUM list and SUM menu keys.
CLR DATA		Clears current list.
YES	ITEM(1)=?	
2 INPUT		Stores minutes of
1 INPUT		advertising (x-values) into
3 INPUT		a SUM list.
5 INPUT		
5 INPUT		
4 INPUT	ITEM(7)=?	
	TOTAL=20.00	_
EXIT NAME	TYPE A NAME: CINPUT	_
MINUTES	TTEM/EN O	Names this list. (See page
INPUT	ITEM(7)=?	30 to use the ALPHA
		menu.)
Now enter and na	me the second list.	
GET *NEW	ITEM(1)=?	Gets a new, empty list.
1400 INPUT		Stores weekly sales
920 INPUT		(y-values) into a second
1100 INPUT		SUM list.
2265 INPUT		
2890 [INPUT]		
2200 INPUT	ITEM(7)=?	
	TOTAL=10,775.00	
EXIT NAME	TYPE A NAME: CINPUT]
SALES INPUT	ITEM(7)=?	Names y-list.
CALC MORE		Identifies the lists for
FRCST	SELECT X VARIABLE	curve-fitting.

136 10: Running Total and Statistics

MINU	SELECT Y VARIABLE	Selects MINUTES as x-list,
SALES	LINEAR *	SALES as y-list, indicates
		current curve-fitting
		model, and displays
		FRCST menu.
CORR	CORR=0.90	Correlation coefficient for
		linear model.

The correlation coefficient calculated above is acceptable to BJ's. Using the linear model, estimate what the level of sales would be if the business purchased 7 minutes of advertising time per week.

7 MINU	MINUTES=7.00	Stores 7 in variable
		MINUTES.
SALES	SALES=3,357,38	Forecasts the sales
		resulting from 7 minutes of
		radio advertising.

How many minutes of advertising should BJ's buy if it wants to attain sales of \$3,000?

3000 SALES	MINUTES=6.16	The business should buy about 6 minutes of
		advertising for sales of \$3,000.†

^{*} If the model named here is not the one you want to use, press MORE MODL and select the one you want.

[†] This result is not the same as it would be if SALES were the independent (x) variable, and MINUTES were the dependent (y) variable.

Weighted Mean and Grouped Standard Deviation

Data in one list (x) can be weighted or grouped (by frequency) by data in another list (y). To find the mean of weighted data and the standard deviation of grouped data:

- **1.** Enter the data values—the x-variable—into a SUM list.
- **2.** Enter the corresponding weights or frequencies—the y-variables—into another list. (To calculate G.SD, the y-values should be integers.)
- **3.** From the SUM menu, press CALC MORE FRCST to display a menu of SUM-list names. The current list is *CURR unless named otherwise.
- **4.** Press the menu key for the list of x-values.
- **5.** Now select the list with the weights (or frequencies) (y).
- **6.** To calculate the weighted mean, press MORE W.MN
- 7. To calculate the grouped standard deviation, press G.SD.

Example: Weighted Mean. A survey of 266 one-bedroom rental apartments reveals that 54 of them rent for \$200 per month, 32 for \$205, 88 for \$210, and 92 for \$216. What is the average monthly rent and its standard deviation?

Create two SUM lists. The first, called RENT, should contain the numbers 200, 205, 210, and 216, in that order. The second can be unnamed and should contain the numbers 54, 32, 88, and 92, in that order.

Keys:	Display:	Description:
SUM		
CLR DATA		Clears current list or gets a
YES		new one.
or		
GET *NEW	ITEM(1)=?	
200 INPUT		Stores rents into a list.
205 INPUT		
210 INPUT		

138 10: Running Total and Statistics

216 INPUT	ITEM(5)=?	
	TOTAL=831.00	
EXIT NAME		Names this list RENT. (See
RENT [INPUT]	ITEM(5)=?	page 30 to use the ALPHA menu.)
GET *NEW	ITEM(1)=?	Gets a new, empty list.
54 INPUT 32 INPUT 88 INPUT		Stores frequencies into second list.
92 INPUT	ITEM(5)=?	
	TOTAL=266.00	
EXIT CALC		Displays names of all
MORE FROST	SELECT X VARIABLE	SUM lists.
RENT	SELECT Y VARIABLE	Specifies <i>RENT</i> as the <i>x</i> -list.
*CURR	LINEAR	Specifies the current, unnamed list as the <i>y</i> -list and then displays the FRCST menu. (Ignore model type.)
MORE WIMN	209.44	Average monthly rent.
G.SD	5.97	Standard deviation of the rents.

Summation Statistics

The summation values are of interest if you want to perform other statistical calculations besides those provided by the calculator. To find Σx , Σx^2 , Σy , Σy^2 , $\Sigma (xy)$, and n, the number of elements in either list:

1. Display the FRCST menu and select the x- and y-lists as explained in steps 1-4 of the instructions on page 134. To find the summation

statistics for just one list of data, specify the same list for both x and y.

- **2.** To see *n*, press MORE SIZE .
- **3.** Press MORE again to display the summation menu, and press the menu label for the value you want.

Doing Other Calculations with SUM Data

If you would like to do other statistical calculations with SUM data besides those in the CALC menu, you can do so by writing your own Solver equation. There are Solver functions that can access data stored in SUM lists, and there is a summation function that can combine all or part of the values stored in specific lists.

Refer to "Accessing CFLO and SUM Lists from the Solver" in chapter 12.
